with works and general offices at Milwaukee, Wis., and Chicago offices and salesrooms at 48 and 50 Lake street, favor us with a copy of a very tastefully prepared catalogue which has just been issued from the press. The volume is composed of 160 pages of letterpress, bound in book form, with stiff board covers, and carrying side titles in silver and black upon a ground work of deep straw color. The printing is in two colors, and the edges of the pages are finished in bright red. Each page is embellished with an ornamental corner piece, printed in chocolate, while the body of the page is in black. The opening pages of the volume carry bird's eye views of the company's plants in Milwaukee and Troy, N. Y., and a sectional view of a dwelling equipped with one of the company's ranges and heated by one of their boilers. The line of goods shown in the catalogue cover a wide variety, all of which are profusely illustrated and fully described. The ranges are represented by the Fuller-Warren Company's Stewart, intended for burning hard or soft coal or wood; the P. P. Stewart, a six-hole range, with sheet flue and single oven, being an entirely new construction fitted with the company's oval fire box; the Matchless, a very pretty stove embellished with nickel and cast ornamentation; the Signal Stewart, a four-hole range having large sheet flues, patent oval fire box, with draw-center or duplex grate; the Royal Diamond, a new wood-burning range embodying all the modern improvements, and the National Diamond, another new range for burning wood, and made in the usual styles and sizes. Several pages in the catalogue are devoted to the company's wrought steel oven range, which has met with a very gratifying sale since its introduction to the trade. It is referred to as being of satisfactory construction and operation and as having a system of oven ventilation which gives results in the roasting of meats, &c., "fully equal to the best given by radiant heat, while at all times the air in the oven is kept fresh, pure and wholesome." This range is made with single and double oven and in portable form, as well as adapted for brick work. Among the cook stoves may be mentioned the Stewart, Signal Diamond, Hearthside, National Diamond, Popular Diamond and the P. P. Stewart. Many of these are new patterns and embody the modern improvements. The P. P. Stewart base burner for 1893, occupying the leading place among the heaters, is of handsome appearance, and contains, the company state, all the successful features found in other first-class base burners, with many original and distinctive ideas, which make it entirely satisfactory in operation. It is offered in three sizes, having fire pots measuring 13, 14 and 15 inches respectively. The Splendid Stewart is a new base burner for this season, constructed for the purpose of meeting the demand for a leading stove of square shape. It is rich in its ornamentation and combines a judicious use of nickel plate in combination with cast decoration. There are also shown a large number of round sheet-iron heaters, oak stoves, globe, cannon and laundry stoves, farmers' boilers, fire place heaters, furnaces and hot-water boilers. The catalogue throughout gives evidence of careful arrangement and attention to details in which the dealer is interested.

ODD PLATES.

From the Buckwalter Stove Company of Royersford, Pa., it is learned that some changes are being made to the Eclipse Duplex furnace which will greatly improve its appearance and efficiency. When complete it will make another full line of Duplex furnaces.

Thomas R. Cook, Jr, is now representing J. P. Schaffer of Pittsburgh, Pa., whose business of hot-air and hot-water heating requires additional expert attention. A long service with the Abram Cox Stove Company of Philadelphia, both on the road and in the foundry, have given him valuable experience in making, selling and setting stoves and furnaces.

The William G. Fischer Mfg. Company, Kokomo, Ind., are mailing postal cards to their customers, requesting that all orders for repairs be sent direct to the company. They say that they are located in Kokomo, Ind., and are there to stay. They are sole owners and manufacturers of the Fischer wrought-steel ranges and cooking apparatus, and request dealers interested in goods of this kind to send for catalogue and prices.

From V. Clad & Sons, 117 and 119 South Eleventh street, Philadelphia, we receive an engraving of "The Waldorf." The kitchen of this $5,000,000 hotel has been equipped complete to the smallest detail by them. There are over 70 feet of Clad's steel plate French ranges and broilers, covered with fancy Gothic hood, all specially made with aluminum trimmings, besides the vegetable range, gas terrapin range, bread toasters, griddle and waffle ranges, copper stock boilers, urns, carving tables, &c. The equipment of such a kitchen is looked on with pride by the house.

The Brand Stove Company, Milwaukee, Wis., are sending out a neat little catalogue relating to their Famous gas stoves and ranges, which are made in a variety of styles and sizes. The ranges are constructed entirely of cast iron, while the piping is nickel plated, giving to the ranges an attractive appearance. The burners are operated by brass nickel-plated valves, by which the flow of gas into the air chamber is controlled. The air supply is regulated by means of a brass plate furnished with each burner, thus enabling the user to maintain the proper balance between the air and gas pressure. The flue arrangement is such that an even distribution of temperature in the oven is secured. The range is lined with asbestos throughout, and its construction is first class in every particular. The Famous oil ranges and stoves are also considered, their special features and advantages being set forth in a manner calculated to interest the dealer. A reduced price-list of Famous oil ranges and stoves is a feature of the little pamphlet.

Head's Iron Foundry of Utica, N. Y., has placed upon the market for the season of 1893 a steel furnace which is known to the trade as the Standard. It has been brought out to meet the demand for a low-down, low-price heater of large capacity, intended for using coal, gas or wood. The cast-iron portion is made heavy, strong and durable, while the material used in the radiator is said to be first quality heater drum cold-rolled steel, of unusual thickness. The course of the draft is toward the front and completely around the radiator to the smoke outlet at the bottom of the radiator on the opposite side. The division plate is adjustable and may be placed either to the right or left of the feed door, while the collars on the radiator may be placed either for the smoke outlet or clean out, according to the position of the division plate. The furnace being of low elevation, is especially desirable for cellars of small hight, while insuring rapid transmission of the heated air to the rooms above. The company are also directing the attention of the trade to their Standard air blast furnace intended for burning soft coal. This heater is constructed in a first-class manner, has large heating capacity and has been thoroughly teated. In order to thoroughly consume the dense smoke and soot arising from the use of some qualities of soft coal, the manufacturers have added to their regular Standard soft coal burning furnace an apparatus which is designed to properly mix the requisite amount of air with the gases arising from the fuel in order to promote combustion. The makers state that in this heater soft coal burns with a bright red flame and leaves no unpleasant odors or dirt. Explosions of gas is said to be obviated and a perfect control of the fire obtained.

The Fuller-Warren Company, Milwaukee and Chicago, have issued from the press a price-list of their top return flue warm-air furnace, combination warm-air and hot-water heaters and hot water boilers. It is a work of over 70 pages, profusely illustrated, and gives, in addition to a general description of the goods named, tables of sizes, prices and information of interest to the furnaceman. A feature of the work is bird's eye views of the establishments in Milwaukee and Troy and a telegraph code by means of which goods may be speedily ordered by wire. The company state that in order to fully meet the increased demand for new improvements and conveniences they have completed several new patterns in both furnaces and hot-water heaters, which are illustrated and described in the catalogue. In addition they have arranged the triangular bar grates for many sizes and styles of their furnaces and hot-water heaters and boilers, but the grates will be furnished only when specified on order, as a majority of the trade prefers the draw-center shaking grate, which in the past has given entire satisfaction. The company have also provided larger casing rings for several furnaces, which increases the heating capacity without increasing the selling price.

Col. Augustus S. Bement of E. Bement & Sons, Lansing, Mich., manufacturers of stoves and agricultural implements, and uncle of Mayor Arthur O. Bement of that city, died of heart disease while on his way home from the works on the 12th inst. He was a brother of the late E. Bement, founder of the extensive institution, and was 65 years old.

The case of William M. Brinkerhoff and Dexter A. Smith of Auburn, N. Y., against the Fuller-Warren Stove Company of Troy, N. Y., has been referred to A. M. Mills of Syracuse, N. Y. The suit was brought to recover about $20,-

000 royalties alleged to be due under a contract between the parties to the suit, respecting the use of the plaintiffs' patented ventilating attachment for stoves and ranges. The real question in the case is said to rest upon the definition of the word "practicable," as it is read in connection with the other words in the contract, the defendants agreeing to use the ventilating apparatus upon all stoves and ranges "so far as practicable."

Rathbone, Sard & Co., Albany, N. Y., say that this, the year of the World's Fair, will be also distinguished as the year when they made the greatest display of new and improved patterns in stoves. In 1891 and 1892 their pattern shops turned out almost entire new lines of both cooking and heating goods, but the additions this year are even greater. They will in the near future print a new catalogue, and this month their salesmen will start out on their fall canvass with photographs of their new goods.

From the March-Brownback Stove Company of Pottstown, Pa., is received a catalogue covering their heater, range and grate departments, and forming a special edition designed for the use of builders, architects and dealers. Their new Crown hot-air furnace comes first, with cuts, description, dimensions and heating capacity, for the convenience of the purchaser. The Crown steam heater is shown by a broken view and a cut of the patent return water heater, followed by a detailed description of its advantages and a long list of those using the heater with satisfaction. Hot-water heating for dwellings is then explained, and cuts show the Scollay patent hot-water boiler complete and by a sectional view, and another sectional view shows a dwelling warmed by hot-water circulation. The range department is devoted to the New Globe, adapted for either horizontal or vertical circulating boilers, with all the modern conveniences and some special constructive features. The top oven plate is made in two parts, greatly increasing its durability, and the long center is cut and supported to prevent sagging in the middle. The Boston ring cover is used, which, it is claimed, will not crack or bulge. The ranges are furnished with either duplex or Prismatic grates, and the fire bricks are held by self-locking brick clamps. These ranges are made to meet all the requirements for flats and dwellings. The grate department shows the Art Franklin, set in tile or fancy brick work. It has all the beauty of an open grate, and is made to give heat to a room above, or additional heat by circulating the air in the room. A sectional view shows the manner of setting it to heat a room above. The last page of the cover proclaims the company as the makers of Welcome Globe ranges, a circular of which is inclosed, and another circular shows their Quick Heat portable caldron.

The Yeager-Hunter Spring City Stove Works, Spring City, Pa., have introduced something of a novelty in the decoration of their stoves. The oven door carries a heavy French plate panel, the effect of which is very striking, and permits all parts of the oven to be clearly brought to view when the door is closed.

The Favorite Stove & Range Company, Piqua, Ohio, refer in another part of this issue to the extensive buildings and large additions of machinery made to their works the past year as increasing their capacity to such an extent as to give them ample facilities for promptly and satisfactorily meeting the demands of their trade. We understand that the company are contemplating many new patterns for the fall business, and are looking forward to a gratifying demand. Their works cover a large area, as may be inferred from the statement that the depth of the buildings is 1270 feet.

The Magee Furnace Company, with New York office at 242 Water street, have among their samples a specimen range of a new variety, recently brought out and something similar, although not so elaborate, as those now on exhibition at the Chicago Exposition. It is called the Magee Grand, and, including the various kinds, can be furnished in from 15 to 20 styles and sizes. The range at the New York office is resplendent in nickel-plated ornamentation, which pleases the eye, although not necessary where economy is an object. What they call attention to is not any radical or particularly novel features, but the excellent material and workmanship, closely fitted joints and combination of conveniences so much appreciated by competent housekeepers. At the back are provided two shelves, on which dishes may be placed, although it is furnished with but one shelf when desired. At one end is a hot water reservoir, for use where range boilers are not employed, made of copper, and tinned. The cover to this, which is flush with the top of the range, is of galvanized iron. The oven door is opened by means of a foot lever, while one of the holes is supplied with a set of rings, permitting of 3, 5, 7 and 9 inch holes being used as desired. Another advantage is a close-fitting cast-iron ash pan in front, under the well-known Dockash grate, which will not permit cinders passing between the pan and range. A broiler door above is also one of the conveniences, while on the oven door is a circular thermometer, with a black dial about 2½ inches in diameter, graduated to indicate a moderate, medium, or hot oven. The damper connecting with the stove pipe works in connection with a check draft that also serves as a medium of getting rid of offensive odors. There is a damper to regulate the supply of heat to be thrown around the water boiler or reservoir, which may be cut off entirely when not needed or increased heat is wanted for concentration on the oven.

The damage reported in the recent fire in the japanning room of Rathbone, Said & Co., at Albany, N. Y., was overestimated, as has been found by further investigation. The company have repaired the damage and are now running as if nothing had happened.

The Round Oak Stove Works of Dowagiac, Mich., are busy in all departments in turning out their leading specialties, for which there is a gratifying demand. We understand that the foundry is melting about 40 tons of iron a day.

S. W. Graves & Co. of 624 and 626 Gay street, Knoxville, Tenn., have issued an attractive pamphlet of 16 pages, in which are illustrated a few examples of the company's line of wood mantels, grates, andirons, fenders, fire sets, &c., adapted for any of the rooms or halls of modern houses. The mantels are also adapted for hotels and flats where good taste and workmanship are wanted at moderate prices. The mantels are made in large quantities and carried in stock in oak, ash, birch, cherry, maple, walnut, sycamore and magnolia. The designs shown are neat and attractive and are sufficiently varied to meet the wants of the trade.

We understand that the plan of consolidating the Wallace Foundry Company, of which Wallace & Williams are proprietors, and the Girard Stove Works of Girard, Ohio, and forming a stock company with a capital stock of $30,000, has been approved by the local board of trade. The committee which was appointed at the recent meeting of the citizens to investigate the business of the two plants has made a very favorable report, and it seems to be the unanimous opinion of the committee that the investment will prove safe and profitable. It is stated that nearly one-third of the stock has already been subscribed, and it is thought that the balance will be placed within a few days.

In our issue for last week we called attention to a new stove which has recently been constructed for use by the National Guard of the State of Pennsylvania during their encampments. A test of the stove has since been made by a military commission composed of high rank officers of the National Guard and with results which, we are informed, were highly satisfactory. The designers of the stoves, Messrs. Schraeder & Schimpf of Pottsville, will apply for a patent covering the essential features.

Page Brothers & Co., formerly Williams, Page & Co., of 227 to 233 Cambridge street, Boston, Mass., have recently added to their interesting line of oil heaters, known under the name Ladies' Delight, a new size, which is provided with japanned iron legs. The burners employed are constructed on the central draft principle, the parts being so arranged that no heat is transmitted to the oil. As an additional safeguard the company place over the top of the oil tank a wooden shelf with metallic covering, which prevents the tank from becoming heated by the reflection or radiation from the burners. There are also provided seamless brass burner tubes, brass reservoir and other features, which render it light, durable and ornamental. The manufacturers state that they guarantee the stoves to be absolutely safe and odorless, that the flame will always remain as originally set and will not draw up and smoke. The oil cooking range has a special feature in the shape of a double chimney, which prevents the radiation of heat at the sides by conveying it to a hot-air chamber at the top, thus increasing the capacity of the stove, the comfort of the user and effecting a saving of fuel. The stoves are made in several sizes and provided with one or more burners, according to requirements.

The Portsmouth Stove & Range Company, Portsmouth, Ohio, are doing a good business and making heavy shipments of Model ranges to points in Northeastern New York. The company have just completed the purchase of a fine line of patterns of stoves and ranges intended for burning coal and wood. We understand that they formerly were the property of the Witman Stove Company of Ironton and were designed to equip a large foundry which was to be operated in Virginia. In addition to these President Knaus has purchased another dynamo for the nickel-plating department, as the rush of business has been such as to render increased capacity in that department desirable.

TRADE REPORT.

The Iron Market.

A very conservative spirit pervades the entire Iron and Steel trade, the principal occupation of many manufacturers and dealers being to stimulate the collection of outstanding accounts and at the same time delay payments to others. Sharp dunning on the one hand and clever dodging on the other are popular arts just now.

It is undeniable, however, that the worst fright is over. Prices are down to a point below which they cannot be driven in ordinary transactions; but while the present stringency in money continues it is just as difficult to attempt an advance. So far as the past week is concerned nothing has occurred to cause further depression, neither is there anything in sight likely to cause any immediate improvement.

Pig Iron.—There have been some inquiries for round lots in New York, both for Anthracite and for Charcoal Pig, a consumer of the latter asking for a considerable quantity. While the supply of Foundry grades from the Lehigh Valley is taken care of quite well, as much cannot be said of Gray Forge, which is feeling the decline in the consumption of the puddling mills quite severely. There are indications of weakness, too, among some of the Alabama furnaces, while in isolated cases Virginia furnaces are holding out for an advance of 25¢ on the lowest prices made. We quote Northern brands at $14.50 @ $15.25 for No. 1; $13.75 @ $14.50 for No. 2, tidewater. Southern Iron, same delivery, $14 @ $14.50 for No. 1; $12.75 @ $13.50 for No. 2, and $13 @ $13.50 for No. 1 Soft.

Last week's report of the Philadelphia market would exactly define the situation to-day, except that sellers think their position is strengthened by an anticipated advance in freights from the South, which is expected to go into effect June 1. Apart from this, business moves along on the same lines as before, good Irons being scarce and in demand at full prices, others not specially abundant. It has been supposed that most of the Iron held for advances has been pretty well cleaned up, but as every week seems to produce a new lot from some source or other, it cannot be that supplies are completely exhausted. For the present, however, business is confined chiefly to covering immediate requirements, and usually at prices about as follows for Philadelphia and equivalent deliveries, with 25¢ @ 50¢ less on Southern brands at Harrisburg and intermediately to Baltimore:

American Scotch, No. 1X...	$16.00	@	$16.50
American Scotch, No. 2X...	15.00	@	15.50

The condition of trade in the West during the past week was rather discouraging to sellers. Transactions have been light, and few inquiries are now coming forward. It is a fact worth notice, however, that consumption keeps up remarkably well. Shipments are heavy on old contracts and consumers in very few instances are asking to have deliveries deferred. Prices of Northern Iron have not been affected by the financial situation, as makers are in no hurry to force Iron on the market. Some Southern companies, however, are making strong efforts to push sales, and are offering concessions beyond anything previously known here. It is a good time for buyers who are able to pay prompt cash, as they receive special consideration. The molders' strike in the local foundries is now about over, and the net result is in favor of the employers. Quotations are as follows, cash, f.o.b. Chicago:

Lake Superior Charcoal.....	$16.50	@	$17.00
Local Coke Foundry, No. 1	13.75	@	14.25
Local Coke Foundry, No. 2.....	12.85	@	13.25
Local Coke Foundry, No. 3	12.35	@	12.75

The tone of the Southern Pig Iron market is easy, with the general disposition on the part of the buyers not to anticipate their wants, so that no large sales have been made, and few run many months into the future, although the furnaces are willing to sell for the whole year on the basis of current prices, and we learn of one sale where the deliveries run for 12 months, or four months into next year. There has been a pretty satisfactory volume of business in the aggregate of small lots for immediate and short forward delivery, seldom more than three months, and of nearly all varieties of Southern Iron, but chiefly No. 2 Foundry and Gray Forge, with a fair quantity of No. 1 Soft. Prices of these grades have been more generally $8.75 for No. 2 Foundry and $7.75 for Gray Forge, f.o.b. Birmingham, prompt delivery and sharp cash. Quotations are as follows:

Foundry.

Southern Coke, No. 1.	$13.25	@	$13.50
Southern Coke, No. 2.....	11.75	@	12.00
Southern Coke, No. 3.....	11.00	@	11.25
Ohio Soft Stone Coal, No. 1....	16.00	@	16.25
Ohio Soft Stone Coal, No. 2 ...	15.00	@	15.25
Mahoning and Shenango Valley	14.75	@	15.00
Hanging Rock Charcoal, No. 1..	19.00	@	19.25
Hanging Rock Charcoal, No. 2..	18.00	@	18.50
Tennessee and Alabama Charcoal, No. 1	15.50	@	15.75
Tennessee and Alabama Charcoal, No. 2.....	14.50	@	14.75

The projected steamship line from Tacoma to Honolulu will commence running in a few weeks.

Metal Market.

Pig Tin.—The weight of heavy supplies here, together with unfavorable advices from Europe, has caused a further sharp decline in prices. On Monday, when the pressure was greatest, Straits was offered at as low as 19 60¢ net cash on the spot, while sales were made of May and June delivery at the same price, showing a decline for the week of over ¾¢ ₱ lb and about 1¼¢ from the extreme highest point reached when the McKinley "bull" fever was highest. Toward the close of the week there was a decided reaction and better general feeling, with circumstantial evidence that the "bull" interest have regained control, temporarily at least. As a whole, the statistical position would indicate that the proposed duty has been well discounted by speculators and that the near future of the market depends in a great measure upon the staying qualities of the largest holders here of Tin afloat for this country.

Copper.—There was quite free offering from first hands early in the week of Lake Superior Ingot at 11¢, Electrolytic at 10⅝¢ @ 10¾¢, and Common Casting at 10⅛¢ @ 10¼¢. It is understood also that sales of Casting Copper have been made at prices below the popular quotations.

Pig Lead.—Sales have been made of about 300 tons Common Domestic at 3.80¢ for near future delivery and rumor had it that as low as 3¾¢ was touched in at least one instance. At the close the market was 3¾¢ bid, 3.85¢ asked.

Spelter.—Prices for Western have suffered a further decline and the market is at present in a depressed condition, suffering from heavy production and indifferent buying on the part of most consumers.

Antimony. — Dealings have been moderate and the market is rather easy, without, however, any radical change in prices. Current quotations are 10¢ for Hallett's, 10¼¢ @ 10¾¢ for L.X., and 10½¢ @ 10¾¢ for Cookson's.

Tin Plate.—There has been no improvement in the demand for Plates for either prompt or future delivery, and the movement at present is largely deliveries on old contracts. Arrivals have been quite heavy, affording good supply and assortment, but there is no sign of burdensome holdings, and prices remain fairly steady except for Wasters, which are offered lower.

Coal.

The Anthracite Coal trade is quiet, and there is nothing unusual to report concerning Bituminous. The small steam sizes of Anthracite are scarce and in good demand. Lehigh is selling a shade above the company schedule and may be quoted as follows: Chestnut, $4.25; Pea; $2 40 @ $3.25; Buckwheat, $1.75 @ $2.35. Lehigh Broken and Egg are $4 and Stove $4.25. There is much conjecture respecting a proposed advance June 1, but, in the present state of the market, doubts are expressed whether it could be realized. Production for the week, 732,000 tons, which is a trifle less than for the corresponding week last year, but since January 1 production is 1,185,000 tons larger. The compsnies feel the need of restriction.

At a meeting of the Coal operators of West Virginia 50 companies were represented. A State organization was effected, to be known as the West Virginia Coal Exchange. Officers were elected, of whom John Cooper of Coopers is president.

The Ohio miners' strike was settled at Columbus, Ohio, the workmen agreeing to return to work upon the terms of last year. The miners agreed to waive their demands for an adjustment in the machine mines and Jackson County district.

Governor Pattison of Pennsylvania, in common with the Governors of other States, has appointed delegates to the great anti-Coal combine convention to be held in Chicago, June 5 and 6.

The official mine inspectors of Pennsylvania report that the Bituminous Coal production last year was 46,018,000 tons.

It is stated that the "Campania" in her eastern voyage, the quickest on record, used Pocohontas Coal.

The Reading last week shipped 370,000 tons of Coal, of which 45,000 went to New York, and the Pennsylvania transported 366,700 tons.

Chicago Report.

Scrap.—The local market is stagnant and Old Material is very abundant. Dealers have been buying lately at the following rates :

	Per net ton.	Per lb
No. 1 Wrought Scrap	$12.00	....
Machinery Cast	9.00	....
Malleable Cast	7.00	....
Stove Plate (free of burnt)	6.50	....
Burnt Iron and Grate Bars	4.00	....
Sheet Iron and Hoops	3.00	....
Plow Steel and Breaking Stock	8.00	....
No. 2, such as Shovels, Hoes, &c	4.50	....
Old Boilers—whole (Iron)	7.00	....
" (Iron)—cut in single Sheets and Rings	10 00	....
Old Gas-Pipe and Boiler Tubes	7 50	....
Cast Borings	4 00	....
Turnings	5.50	....
Horseshoes	12 00	....
Copper Bottoms	....	8¢
Copper Clips and Heavy	....	9 ¢
Heavy Brass	....	8 ¢
Light Brass	....	4 ¢
Pipe Lead	....	3 ¢
Tea Lead	....	2¾¢
Zinc	....	3 ¢
Rubber	....	2¾¢

Anthracite. — A continued movement in stocking up is reported among the dealers, but consumers have not yet begun to buy. We continue to quote carload lots of 12 net tons as follows:

	Grate.	Egg, Sto. and Ch.
Chicago, Ill	$5.35	$5.60
Milwaukee, Wis	5.35	5 60
Kansas City, Mo	8 55	8 80
Council Bluffs, Iowa	8.55	8 80
Lincoln, Neb	8.70	8 95
Sioux City, Iowa	8.55	8 80
Aberdeen, S. Dak	8.60	8 85
Dubuque, Iowa	6.65	6 90
Madison, Wis	6.85	7.10
St. Paul, Minn	7.85	8.10
Burlington, Iowa	6.85	7.10
Des Moines, Iowa	8.30	8 55
Davenport, Iowa	6.65	6.90
St Joseph, Mo	8.55	8 80
Leavenworth, Kan	8.55	8 80
Omaha, Neb	8.55	8 80

Colorado Anthracite.

COLORADO FUEL & IRON COMPANY	
Denver	$8.00
Pueblo	8.00
Colorado Springs	8.00
Leadville	8.00
Cheyenne, Wyo	10.00
All points between Denver and Missouri River	9.35

In the advertisement in another column of the S. P. Oil Company, 1430 South Penn Square, Philadelphia, Pa., is given an illustration of the Self-Pouring Oil Can and its method of operation is shown.

The Capital Sheet Metal Company of Columbus, Ohio, have been chartered, with a capital of $100,000, and will engage in the manufacture of Sheet-Metal products.

At the January, 1893, session of the Connecticut Legislature, the Peck, Stow & Wilcox Company of Southington, Conn., were granted the authority under suitable restrictions to reduce their capital stock from time to time to any amount not less than $1,000,000, it now being $1,500,000. The law thus amending the company's charter provides that the act shall not be valid unless accepted by the majority vote of the stock represented at a meeting of their stockholders duly named and held for the purpose of acting on the same: said meeting to be held within six months from and after the passage of the act.

Sidney Shepard & Co., Buffalo, N. Y., desire us to state that the unfortunate fire which, on the night of the 8th inst., destroyed the works of the Shepard Hardware Company of that city in no wise affected their plant or business, the works of the former company being situated entirely separate from those of the latter company

The Star Mfg. Company, Canton, Ohio, have been organized, with John A. Brobst as president and Frank H. Wagner as secretary and treasurer, the directors being John A. Brobst, Frank H. Wagner, F. B. Smith, Louis Wagner and C. C. Bow. The company will manufacture Hardware specialties, but for the present will confine their attention to the manufacture of the Crystal Valve Oil Can. In the near future they expect to erect a glass works in connection with their plant, as they will require considerable glass in the manufacture of this Oil Can. The company hope to commence operations about May 15.

The Hartman Mfg. Company, makers of Wire specialties, including Fence Materials, Tree and Flower Guards, Wire Mats, &c., whose works are at Beaver Falls, Pa., have been compelled, through lack of room at their former New York offices, 102 Chambers street, to move into more commodious quarters, and may now be found at 277 Broadway, at the corner of Chambers street.

CONDITION OF THE

Hardware Trade.

The condition of business is about as at our last report, with a good deal of unevenness, some manufacturers reporting an excellent demand and being behind their orders, while others refer frankly to the falling off in trade. Reports from Chicago, St. Louis and other Hardware centers refer to the fact that business is on the whole in a very satisfactory condition, and goods moving with at least fair freedom, while others call attention to the continued dullness, which in large measure is attributed to the prevalence of bad weather. The uncertainty in regard to money matters is undoubtedly an important factor in the situation, as merchants and manufacturers see the wisdom of pursuing a very conservative course, assuming only the obligations which they are sure to be able to meet and scrutinizing credits very carefully. This, of course, curtails the volume of business and is doubtless a prudent course to pursue. There have been during the past few weeks comparatively few changes in the prices of Hardware, but the market is not characterized by quite so firm a tone as a few weeks ago, as some of the staple lines which have recently been held quite firmly and at somewhat higher prices than have recently been prevailing are now showing a tendency to weaken. There is also more of a disposition on the part of manufacturers of some kinds of Shelf Hardware to shade prices with a view to inducing orders.

Advices from Chicago.— The dullness noted last week continues, but jobbers are taking the situation more philosophically and are not endeavoring to force trade. Bleak weather has again prevailed throughout this section, checking the demand for summer goods. Wire Cloth seems to have reached its climax at $1.75, with the supply now apparently ample to meet the demand. Poultry Netting is also in fair stock, and prices are stationary. Heavy Hardware is in reasonably fair demand, but trade in that line is by no means active. The rough weather has given the carriage trade a setback, which affects the demand for a wide range of goods.

Notes on Prices.

Cut Nails.—There is a moderate demand for Cut Nails and prices show but little change since our last report. The market is not characterized by a strong tone, but there has been no further open yielding in price, the quotation in the East being on the basis of $1.10 for carload lots at mill. This price, however, is sometimes slightly shaded. Small lots from store in New York are held at $1.35 to $1.40.

Advices from Chicago.—The trade in Steel Cut Nails shows no new developments and manufacturers are quoting

$1.30 to $1.35 Chicago for factory lots and are booking some orders, but not of any magnitude. The season drags along very discouragingly and the distribution from second hands is considerably below the average. Jobbers are selling small lots from stock at $1.35 to $1.40.

Wire Nails.—The quotation for Wire Nails remains $1.50 for carload lots at mill, but the market is not strong and intimations are made that this figure has been slightly shaded. Manufacturers complain that orders are coming in slowly, inasmuch as their large customers are still well supplied and those who are likely to want Nails in the near future prefer to wait for the developments of the market. While the manufacturers are congratulating themselves that the production of Wire Nails durthe past year, as shown in the statistics which were published in our last issue, exceeded that of Cut Nails, they would prefer to have the present demand more vigorous and well sustained.

Advices from Chicago.—Wire Nails are very quiet. So little business is now being done that it is hard to tell what prices are ruling in the market. Manufacturers' quotations are ruling generally at $1.55 Chicago, although a few of them would shade this price if there were any orders in sight which could possibly be secured. The heavy buyers seem to be well stocked, and are turning a deaf ear to inducements. Small lots from stock are selling from $1.70 to $1.75 to country trade and $1.65 to city buyers.

Barb Wire.—There is little to say in regard to Barb Wire. The demand is sluggish and prices are steady. We quote $2.45 to $2.50 for Four Point Galvanized in carload lots at mill. Small lots delivered in New York are quoted at $2.70 for Galvanized and $2.30 for Painted.

Advices from Chicago.—Manufacturers report no improvement in their trade. It is one dead level of moderate business which comes in with aggravating slowness. Quotations are unchanged at $2.20 for factory lots of Painted and $2.60 for Galvanized. Small lots from stock are selling at $2.30 to $2.70, respectively.

Chains. — The manufacturers of Wagon and Fancy Chains have for some time been conferring with reference to a revision of the lists in order to make them represent more closely the present cost of the goods. The changes made are principally in the lists of the following goods: Stage Traces, with clip; Breast Chain, Running or Back Cart Chain, South Jersey Traces, Breech Chain, Tug Chain, Heel or New York Traces, Well Chain, and Rein Chain.

The Abell Coffee Pot.—The Leach Roaster & Baker Company, Paxton, Ill., are manufacturing this article. These Pots are made in two sizes, No. 1, listed at $1, and No. 2, at $1.25. The discount to the trade from these prices is 50 per cent.

Combined Scissors and Tracing Wheel.—This article is put on the market by Pauls Bros., 88 Chambers street, New York, who are selling it to the trade at the following prices:

7	6½	6	5½	5	4½	4	inch.
$5	$4.60	$4.20	$3.90	$3.60	$3.40	$3.20	per doz.

Tinners' Tools.—The following discounts apply to some of the goods of the Niagara Stamping & Tool Company, Buffalo, N. Y., which are shown in their tinners' catalogue, new edition:

Niagara Hollow Punches.....20 and 2 %
" Solid " .....55 %
" Shears and Snips.....20 and 10 %

Indurated Fiber Water Bucket — Cordley & Hayes, 172 Duane street, New York, who are putting this article on the market, are selling it to the trade at $24 per dozen, subject to a discount of 25 per cent.

Cordage.—The Cordage market has developed no new features of importance during the past week, and quotations remain as before. The tone of the market is, perhaps, a shade stronger for the time being at least, inasmuch as most of the manufacturers connected with the National Cordage Company are not in the market. There, seems however, to be no difficulty in obtaining all the Rope needed from outside concerns.

Iron Rivets.—The Iron Rivet market continues in substantially the same irregular and demoralized condition which has characterized it for some time. The manufacturers, however, have been conferring with a view to reaching some understanding in regard to prices, but thus far there has been no change in the situation.

Sifters, Fly Traps, &c.—The principal manufacturers of Sifters, Fly Traps and Corn Poppers have formed the Union Wire Goods Company, having their principal office at Cincinnati, their object being to regulate the prices of these goods and to sell the product of the principal makers. The arrangement is made, we are advised, in the interest of jobbers as well as manufacturers and with a view to establishing prices to the retail trade as well as to the jobbers, for whom a satisfactory margin is thus secured if prices are maintained. The makers of the various brands of the Sifters, Fly Traps and Corn Poppers will take orders as usual, but the billing and collection of the goods is done through the central office of the Union Wire Goods Company, which is in the Masonic Temple, Cincinnati. In the arrangement which has been established the Genuine Hunter Sifter, made by the Fred. J. Meyers Mfg. Company, is quoted at $1.75 per dozen, other Sifters being quoted at $1.50 per dozen. The Harper, Paragon or Champion Fly Traps are quoted at $1.75 per dozen, and the Balloon, Globe or Acme at $1.50 per dozen. The following are the prices on Corn Poppers:

	Per dozen.
Square 1-quart	$1.00
Round 1-quart	1.00
1½-quart	1.25
2-quart	1.50
4-quart	4.00
Double Reversible	1.75

On all of the above goods gross prices have been determined upon, allowing the jobber a fair margin of profit.

Poultry Netting.—There is a good demand for Poultry Netting and prices are well maintained, but while the market has a good tone there has been no general advance. We are advised by the Gilbert & Bennett Mfg. Company that reports have been circulated extensively that Poultry Netting manufacturers are behind their orders and asking higher prices, and stating that so far as they are concerned such reports are without foundation. They have filled their orders promptly and have sufficient stock to meet any ordinary demand for regular sizes.

National Time Register.—The National Time Register Company, Columbus, Ohio, are manufacturing this article. The price of one Register suitable to register 50 persons is $50. Where two are purchased by the same firm or company, a discount of 10 per cent. is given, and on three or more purchased by the same concern a discount of 20 per cent. is allowed.

Glass.—There has been little, if any, change in the condition of the Glass market during the past week. Factories report a perceptible improvement in demand, but local dealers are doing comparatively little business. It is understood that at the last meeting of the National Window Glass Company, held at Chicago, the matter of adopting a new long list was discussed, but that probably no action will be taken until toward the end of the season. There seems to be no reason why an amicable agreement on scale matters should not be reached with the operators for the next fire, which goes in blast usually about September 1. It is reported that the Executive Committee of the National Window Glass Company, held another meeting at Philadelphia last week, because this is looked upon as the weakest spot in the country at present in living up to fixed quotations, and as about the only point at which any great shading of prices is being done. The imported Glass market shows lack of activity, and consequently a disposition in prices to weaken. While it cannot be said that Glass is regularly sold at less than printed quotations, there is reason to suppose that large cash buyers are favored somewhat. It is reported that orders for American Plate Glass are coming in satisfactorily and that quotations are sustained. A Pittsburgh paper states that the National Plate Glass Company have purchased the plant of the Charleroi Plate Glass Company, for which they paid $1,750,000, and that this is the fourth plant secured by this

company, the others being the works at Crystal City, Ellwood and Kokomo. Prices are quoted unchanged, as follows: American Window Glass, 2000 boxes at one time, 80 and 10 and 10 per cent. discount; carloads, 400 boxes, 80 and 15 per cent. discount; less quantities than carloads, 80 and 10 per cent. discount. Freight allowed on car lots and over, not to exceed 17½ cents per 100 pounds; less than car lots, f.o.b. at shipping point. French Window Glass, 75 and 10 and 5 per cent. discount. American Plate ranges in price from 50 and 10 and 7½ per cent. discount to 60 and 5 per cent. discount. Imported Plate Glass, 60 per cent. discount to 60 and 10 and 5 per cent. discount.

Old Rags, Paper, Etc.—The following are the current prices paid for Old Rags, Paper, &c., delivered in New York:

No. 1 White Rags	₱ lb	4 ¢

Jute Rope	₱ lb	1⅞ @ 2 ¢
Mixed Rope	₱ lb	¾ @ ⅞¢

Trade Notes.

L. Schwartz & Co., 89 Seneca street, Buffalo, N. Y., are putting out a new catalogue of Wood Mantels, presenting new and original designs. They state that their producing capacity has been increased 50 per cent. over last year and that they are making a special feature of turning out goods according to architects' drawings which are sent in from all parts of the United States.

Duthie & Dagget Tool Company, Indianapolis, Ind., will at once commence the erection of an entirely new plant, 40 x 200 feet, two stories high, of brick, which will be exclusively devoted to the production of all kinds of Cut Gearing, Fine Machine Tools, and their specialty, the new Sensation Tapping and Threading Machine.

S. E. Hingston, 39 and 41 West Broadway, New York, makes a specialty of Show Cases, for which a large market is found outside of the United States. A feature of the construction, which is patented, permits the show case to be taken entirely apart and shipped in a "knocked down" condition, space rather than weight being the greater consideration in export shipments.

A. C. Beckwith, the metal Pattern maker, is now at 62 Mechanic street, Newark, N. J., turning out metal patterns for malleable, gray iron and brass foundries. Among his patrons are many from distant States, secured by the quality of his work.

Wm. Dixon & Co., 84, 86 and 88 Mechanic street, Newark, N. J., make a specialty of Brushes of every description for metal workers' use for cleaning and polishing work, either by machinery or by hand.

The Electrical Piano & Motor Company have just got in operation at their new quarters at 84, 86 and 88 Mechanic street, Newark, N. J. At present they are busy with the Feldkamp Electro-magnetic Ceiling Fan. This fan can be suspended from a hook in the ceiling, and the same wiring and power required for an electric light runs it. The Feldkamp Electric Motor is another of their specialties, made from ¼ of a horse-power up to 75 horse-power, for which claims are made for simplicity, economy and efficiency.

The Newark Wire & Brass Works are a new house at 261 and 263 Market street, Newark, N. J., making artistic Brass Railings and Grills for banks and offices and Wire Work of all description. Since starting they have fitted up the German National Bank, the office of C. Feigenspan and the *Deutche Zeitung* office. An attractive piece of their work is a beautiful display in their own windows. In one is a handsome window tree, made of brass, in graceful design, and hung with an assortment of brass wire Bird Cages. The other has some fine specimens of brass Grill work, grouped around a central design, resting on a brass easel. That these show-windows attract attention is realized in the fact that they have been the means of securing some substantial orders.

The Safety Electrical Company, at 88 Mechanic street, Newark, N. J., manufacture Electrical Supplies, Motors and Generators, for which they claim special features in safety, durability and full power.

The Kiechler Mfg. Company, Cincinnati, Ohio, have secured the contract to furnish all the necessary Galvanized Iron cans used in the artificial ice plant at the World's Fair, the number up to date amounting to upwards of 1100, which number is being constantly increased. The product of the company will be on exhibition in practical operation as well as in the form of a special exhibit.

C. E. Leveridge, 78 Mechanic street, Newark, N. J., makes a specialty of Mill Supplies. He carries a large line of Sterling Emery Wheel Company's wheels in stock, the consumption of these goods being very great in Newark. A line of polishing and grinding machinery made by this company and by the Appleton Mfg. Company, Philadelphia, are handled by him. To meet the needs of his trade he sells belting of four different kinds.

Clarence M. Kemp, Baltimore, Md., advises us that he has from time to time added to his line of Pipe Vises until he is now putting on the market an assortment equal, he claims, to any other manufacturer. Mr. Kemp is intending to add to this line gradually and hopes to offer such a variety and to quote such prices as will insure him a large trade in this department of his business.

The Convention Season.

Next week is the beginning of the convention season, so far as *The Metal Worker* is concerned, for this year the three trade gatherings in which we are especially interested occur within short intervals in and near Chicago. The stove manufacturers convene May 31 at Chicago, and their deliberations will hardly be well ended before the Master Steam and Hot-Water Fitters' Association come together at Chicago on June 6. A week later, June 13, the National Association of Master Plumbers meet at Milwaukee, so that for three weeks conventions will be the chief subjects of attention in that part of the world. The gatherings this year are likely to be particularly large; but whether they will be particularly profitable from a purely association standpoint is not so clear. The double attraction of the trade gathering and the Chicago fair will undoubtedly bring out a large representation, and the meetings, nominally at least, will be well attended. We think the Plumbers' Association, from a business point of view, has, perhaps, shown more wisdom than the other two bodies; for in meeting at Milwaukee they will have the advantage of a quiet city without the distraction of the World's Fair, and at the same time their members, at the close of the convention, will be in the neighborhood of the show and can easily arrange to spend a few days in Chicago to devote exclusively to sight-seeing. Nevertheless, in spite of the counter attraction of the World's Fair, it is probable that the other two conventions will be well attended and all important business be given the consideration it deserves.

A Worthy Example.

As an incentive for a workman to continue his apprenticeship, after his time has been served, a far-sighted employer, whose business covers several of the trades to which *The Metal Worker* is devoted, has adopted with profit the following plan: A prize in cash is offered, in one or another of the departments, for a method of accomplishing some result with less time, tools and material than are now necessary. One problem, which the employer has solved and tested with the aid of a trusted workman, is now the subject of competition for a ten-dollar prize. To offer a prize for information already obtained, and which could be given without cost, is a novel idea. But the knowledge gained by a workman from the most thorough explanation is insignificant compared with that acquired in the search inspired by such a competition. The natural consequences of the plan is that each competing workman becomes more valuable with each competition. That too many men are economical in the use of common sense is true, and the method of calling it into more active daily use, adopted in the case in hand, has its merit, and the employer confidently asserts that the outlay for cash prizes has been a most profitable investment.

An Ideal Town.

An item of news of considerable interest comes from France. It appears that the problem of providing a suitable central attraction for the great exhibition to be held in Paris in the year 1900 is a matter which has been for some time exercising the minds of the commissioners for that undertaking. Sundry suggestions have been made, including another Eiffel tower, to be double the hight of the original structure, a mammoth telescope and other propositions of a more or less impracticable nature. But all have, for good and sufficient reasons, been rejected. A French scientific journal has, however, come to the rescue with an idea which is said to have been received with great favor. It is, according to the source from which our information is drawn, "to build a town in the exposition grounds to accommodate from 3000 to 5000 inhabitants, and to practically illustrate there the most advanced ideas of construction, heating, ventilating, lighting, water supply, drainage, &c. There are to be real houses, streets, squares, &c., intended for actual use. Electricity is, of course, to play an important part in this ideal town. Light and power for the buildings are to be supplied electrically. There are to be electric elevated and surface street railroads. The sidewalks are to be roofed over with glass as a protection against rain. Model dwellings for workmen, a model school house and a model infirmary are to form part of the town." These details sufficiently indicate the line which it is proposed to follow. Should the conception materialize, such an ideal town would unquestionably form a most important and valuable object lesson, the effect of which could not fail to be good. The expense of the undertaking would necessarily be very great, and this consideration may stand in the way of its realization. It is, however, proposed to meet the outlay, in a measure, by the sale of the whole outfit at the close of the exhibition. We are not informed, by the way, whether it is proposed to stock the town with model citizens and establish therein a model municipality. There is a fair opportunity for instruction of another kind in this field.

Effectiveness of Heating Apparatus.

That there is a wide difference in the effectiveness both of hot-water heating and steam-heating apparatus is a fact known to all well-informed men engaged in the heating trade, but in many instances this difference is accounted for by referring it to anything but the proper cause—namely, defects in the system of piping between the steam boiler or water heater and the radiators. The boiler may be good, the radiators may be the best in the market, yet the result is unsatisfactory. In most such cases it will be found that not enough study and care have been given to arrangement of pipes and radiator connections, to their proper sizes with reference to the surface they are to supply, to their pitch, to the supply in steam-heating pipes of proper relief pipes, to avoidance of traps in pipes, to provision for expansion under the action of heat, and so on to the end of the chapter. These remarks apply to both large and small installments. Some of these defects are not always chargeable to the contractor who puts in the apparatus. Many buildings, large and small, can be found wherein, when first erected, the heating apparatus worked excellently, but in a year or two began to snap and pound vigorously, while its lack of vigor in heating some parts of the building became uncomfortably apparent to complaining occupants. What has happened during the interval between satisfactory testing and the failure to heat successfully is that the building has settled unequally, thus neutralizing, and in many cases often reversing, the inclination given by the fitter to the pipes and canting radiators so that their outflow connections are higher than their inlets. Examine the boiler: you will find there nothing to prevent efficiency. Radiators and valves, water-feeding and draft-regulating appliances may be all in first rate working order. The fault is that the piping has been disarranged because the building has settled, and settled unequally. The "skin builder," not the fitter, is to be blamed in such a case.

Boilers Unjustly Blamed.

It is the usual thing in domestic heating apparatus when defective heating occurs to blame the boiler or the hot-water heater: yet the opinion is here hazarded that among the heating boilers of reputation and which have become widely used careful tests of their efficiency would discover very little difference in the value of their heating surface, foot for foot, when all were put in with equal care and skill as regards the piping. Certainly there would be found no greater difference than is often met with between two boilers of the same design and make, in different buildings in which they have been placed by the same contractor and fitters, and where nothing in the draft of the chimney nor in the construction of the buildings can be assumed to account for the difference. Those who make this kind of heating apparatus, if called to testify could, almost any of them, relate experiences of such inequalities in working. Mr. A, a steam fitter, has put in, say, three boilers of the same kind. The first carried 800 feet of radiating surface. It worked so well that next time, with the same sized boiler, he put in 1000 feet, and "by George! you never saw a boiler work better; it was nothing but play. But on the other job there were only 750 feet of radiating surface and I was afraid the next smaller size would be a little too small, so I put in the same sized boiler again and it won't heat those radiators, do what I may." Every extensive manufacturer of boilers knows this Mr. A, and others just like him. Each of them knows the fault is not in the boiler, and each knows the true cause of the trouble is to be sought in the rule-of thumb way in which Mr. A does his work. On job No. 1 he had fairly good luck and got the whole thing about right. On job No. 2 he did still better. On job No. 3 he blindly stumbled into some mistake. When this is corrected there will be no more trouble with the job. The manufacturer sends some one to set Mr. A right; and as Mr. A is a good customer, having a shop, at which he may be daily found, in almost every county in the United States, the manufacturer considers it advisable to help him out whenever he gets into a hole, so long as he continues to use that line of goods.

Vacation.

BY L. O. AFER.

A few suggestions to the young folks on this approaching season might help some to enjoy it more advantageously than they ever dreamed of. No matter where you live it does not take so much money to go to Washington, Chicago, Niagara, Luray, Manch Chunk, Lake George, Saratoga or the seashore.

The thing of it is to get the money. Well, I know some young folks—clerks, apprentices, and wage-workers—who simply put away so much every week for a vacation fund and in that way $40 or $50 comes easier than would be imagined. No, it is not a waste, for it pays for some of the best education you will ever get and of a kind that will be worth to you far more than it cost; for in the fun you get and the vitality gained you have only a small portion of the return which will keep coming from it as long as you live. A 300 to 500 mile trip takes you a long way from home, and if you have never seen the sea or the mountains you have a treat in store for you. Such a trip brings you among people who are surprisingly different from the folks you know and you will learn many valuable things from them.

If you are a mechanic you will naturally visit the boys in the towns you stop, and in these days of cheap excursions, of unlimited privileges, you can stop off where you please and see the rolling mills, stove foundries, tin-plate mills, or whatever interests you most. It is a good lesson in geography to hunt up a trip or several trips, and a good fellow to help you and one who will be glad to do it, when he has time, is the traveling man that you buy goods from—ask him. If you have never traveled and have no companion for the trip, that does not make any difference; in fact, it is all the more reason for you to begin alone. It will make you think ahead a little and improve your manners, too, for strangers are entitled to a courteous address, and we are all apt to get a little remiss in the treatment of our friends. When you start off remember that the railroad men can and will answer all of your necessary questions and are reliable, and if they have time and you show your genial side they can give you a lot of information about the points of interest you will pass.

Another source of information that will never be denied you if properly addressed is the traveling man, whether he sells lace or lumber, stoves or diamonds. He knows all about the hotels and boarding houses and their prices. By the way, when you start make it a point to keep account of every penny you spend, as it will be almost as good as a diary of the trip, which you might find a task on your time. Go to bed early and get up early while you are off, for then you will see more and can stand more, and you will come home better, continuing to improve after you have been home some time.

Two young fellows went from Philadelphia to Niagara, stopping at Watkins Glen and returning through Manch Chunk and the Lehigh Valley, for $35 each, and were gone eight days. Another young chap went from New York up the Hudson to Saratoga, through Lake George and up Lake Champlain to Burlington, Vt., and across the mountains, down the Connecticut Valley, back to New York, in ten days, for $50.

Many regular traveling men on the road do not spend over $5 a day on an average. When you come home after such a tour of education just put what you have learned into practical everyday use and everybody will be glad you had that vacation.

Mercantile Credits.

It cannot be denied, says *The Iron Age*, that business men are now passing through a crucial period. While the entire situation may in truth be pronounced tranquil, there is evident disturbance and some degree of apprehension. This appears from the frequency of failures among those who are dependent on credit and bank accommodation. Naturally institutions "banking on wind" are among the first to go, sharing the fate of that class of stocks which have been watered to an extreme, and of those speculators and business men whose operations have been unduly extended, because of their inability to borrow money any longer on doubtful collateral. So long as confidence remained they could go on, but when for any reason distrust is excited more margin is called for and then their collaterals are thrown out altogether. Thus, we notice at the present time that there is no lack of loanable funds at a fair rate of interest where the security is undoubted, but collaterals are scrutinized and the financial standing of individuals and firms is the subject of inquiry. Those who rely on note brokers for accommodation are especially exposed.

This undesirable condition was brought about primarily, it will be remembered, by distrust respecting the ability of the general Government to maintain specie payments in the face of an extraordinary foreign demand for gold and declining receipts. The Sherman Silver law was recognized as the chief impediment in attempting to uphold the standard of value. Then followed the collapse of industrial stocks and the enforced assignment of prominent individuals or firms who were in some way involved as borrowers. We have later, in quick succession, the failures of "strings of weak banks," mostly in Illinois and Indiana, which have been doing business on corrupt principles, and which Senator Sherman hastens to say, contrary to report, he unhesitatingly condemned.

Among New York bankers the troubles here referred to are viewed with unconcern, as they cannot in any proper sense be taken as an index of general business. Banks in the association are in excellent condition, as shown by the last weekly statement. There was a further contraction in loans, equal to $5,000,000, and the result of all the changes was a gain of about the same amount in reserve, which now stands at nearly $18,000,000 in excess of legal requirements, against less than $16,000,000 in the corresponding week a year ago. The contraction here observed does not, a bank official explains, signify a contraction of credits, but is the result of liquidation mainly connected with stock operations. Money, as before remarked, is in good supply. Another good feature is the improved condition of the Government Treasury, there having been last week a gain in the gold balance of upward of $2,000,000. The Treasury situation excites no further apprehension.

The latest cause of concern is the sweeping disaster that has overtaken banks in Australia, wiping out large amounts of British capital and increasing the demand for gold.

ROOFING AND CORNICE.

Laying Steel Roofing.—I.*

BY L. S. BONBRAKE.

Steel sheets as a material for roofing have been in active demand since the idea originated to use them, some seven or eight years ago. Previous to that iron sheets were in use. While steel has not had the same time test as ordinary charcoal iron, which has been used for roofing over half a century, yet so far as used it has proven more satisfactory from the fact of its greater tenacity, being smooth and soft to work. In the early days of its existence it was received with doubt and considerable misgiving, and was but little known except in the immediate neighborhood of the pioneer cities of its manufacture—Cleveland and Cincinnati, Ohio. Garry of the former and Scott of the latter place can be mentioned as fathering this industry, which has reached such a wonderful degree of magnitude as to surprise every one familiar with the iron business.

Starting in small degree, the steel-roofing industry is now the mainstay for over one-half the rolling mills in the land, and factories have increased from a few in Ohio until they are now found in every State, reaching from the Atlantic Ocean to beyond the Mississippi River; and, starting as a shed covering, steel now protects the interior of the most handsome places in the great centers of civilization.

The day to question the durability of steel as a material for roofing is past. Its advantages are numerous and so clear that many sturdy advocates for other materials have discarded old prejudices and taken it up. The business is near its zenith and can be continued for time indefinite if quality of material is given proper attention by the manufacturer of roofing, rather than increased sales by a low price. If prices are cut let quality be known, as it must necessarily result in detriment to quality, and one roof of poor quality in a neighborhood not only injures the firm making it, but injures all manufacturers to an extent ten good roofs will not overcome.

Steel, without metallic coating, of whatever sort, and rolled in lengths about four times that of ordinary terne-coated sheets,* can be converted into roofing much cheaper than the latter, even when of heavier gauge, and the double-lock cross seams now in use prevent trouble at that point.

PAINTING ROOFS.

It is a fact indisputable that upon the proper care in painting ordinary metallic roofs is based all hope of durability. Too much care cannot be taken in this matter, as upon it almost entirely hangs the longevity of terne or steel roofing. It is not the frequency of painting so much as the quality of and manner in which the paint is applied that gives the desired protection. Painting too often will make a coat or coats too thick to allow of contraction or expansion to conform with that of the sheets, and results in cracks and open streaks, which form a recess in which soot, dirt and dampness work havoc with the roof material.

We find a good rule, and one largely followed by experienced workmen, is to paint the roof immediately after it is laid complete. If a roof is laid and painted in the fall, the following spring it should be given another coat, or the second coat should go on not later than six months after the first. In one year from the second, the third coat will have given it three in 18 months, after which painting every four or five years will give sufficient protection to warrant its lasting fully or over half a century. While graphite is being used, and highly recommended, and has proven an excellent "filler" or body, yet iron oxide is more commonly used than any other material (yellow ocher excepted, in some localities). A successful manner of mixing, when the oxide of iron has not already been ground to a paste, is to pour ½ gallon of pure boiled linseed oil over 10 pounds of the dry metallic oxide some little time before wanted for use. When thoroughly soaked to a paste use 7 pounds to 1 gallon of oil. If the weather is damp or unfavorable use a small quantity of pure turpentine dryer to help "tack" the paint and prevent creeping.

A matter of vital importance too often overlooked when repainting a roof is having the roof clean. In many instances where the roof has not given full satisfaction, its failure to last as it should has been traced to neglect in getting the surface properly prepared to receive the paint. Soot, dirt, scales and blisters have been painted over with a reckless disregard of time wasted and labor lost that is to be deplored. All of these are detrimental to the durability of the roof, and should be removed by scraping and sweeping before paint is allowed to be used. Don't use a broom or whitewash brush to paint with. If worth painting at all, do the work well. Use a good 4 or 5 inch hair brush and see that the seams and uneven places are thoroughly coated as well as the smoother surface of the metal.

THE ROOF FOUNDATION.

The question is often asked: "What is the better surface on which to lay a metal roof—sheeting or lath?" Actual tests under the same favorable surroundings have proven beyond question that under any circumstances close sheeting is preferable to open sheeting or lath.

It is especially noticeable when a roof is laid over an engine, or a room in which steam is escaping, and numerous instances are cited where the body of the roof has given

Laying Steel Roofing.—Fig. 1.—Roof Fastener.

out entirely between the lath, while that part immediately on the lath remained intact.

To prevent dissatisfaction and provide for the durability of the roof under trying conditions, as mentioned, tight sheeting covered with felt or rosin-sized paper should make the foundation for the metal. This manner of treatment has proven entirely satisfactory and durable.

A metal roof should not be laid over old shingles, which is often done in the Eastern States, the result being invariably poor. It is impracticable, unworkmanlike, and withal disastrous, and in many instances the cause of fire, for the shingles become as dry as punk under the metal and are readily ignited. Moreover, for firewood, they are well worth the time taken to remove them. Aside from its rough appearance a roof laid over old shingles is very uncertain in its anchor fastening and invariably insecure, as the workmen are liable to drive nails in the extreme edge of lath instead of center, and may, in fact, miss it altogether.

ROOF FASTENERS.

At times annoyance is experienced to some extent by the rattling of steel roofing, caused by the sheets being anchored loosely and not bound down snug and tight to the sheeting or lath, or by suction in rain and wind storms, causing vibration, lifting the sheets at their centers, and again dashing them against the sheeting. When a roof of this sort is found, and the noise is objectionable, it can be remedied by using a fastener, as shown in A, Fig. 1, and adjusting one or two to every sheet on the roof.

The fastener is made by using a heavy 1-inch wood screw and 1-inch cone-shaped metallic cap, with 1¼-inch rubber or lead washer. A hole should be punched through the center of each sheet of such size as will admit the screw by forcing it. The washer is placed around the hole and the metallic cap screwed down tight upon it, as shown by B, Fig. 1. When further security is desired the fastener may be used in the center of the cross seams, between the standing seams, but when so secured it is recommended not to force the cap down too tight. While there is but slight danger of leaks at points of fastening, additional protection can be had by covering the whole fastener with a good roof cement, shaping the cement to a point, as a cone.

* Copyrighted 1893, by L. S. Bonbrake.

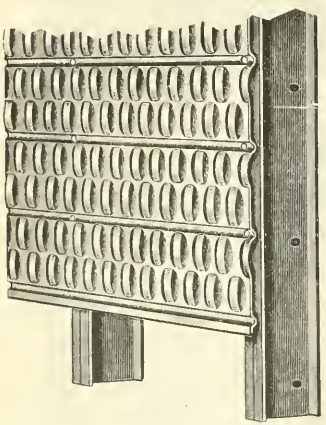
When cement is used upon a roof it is advisable to moisten with paint the surface to be cemented, and after the cement has been applied it should be smoothed over with paint mixed as thick as can be used with the brush. When trouble is experienced with cross seams connecting the steel roofing proper to tin or galvanized iron gutters, and the roof is of such pitch that cementing is deemed unsafe, the steel may be soldered to the gutter material. This may be accomplished by first filing, scraping or sandpapering the edges of the steel bright, after the hem or hook has been formed. When bright, they can be readily tinned by the use of strong muriate of zinc and ordinary solder; when tinned the two metals can be solidly united, after which the seam should be thoroughly cleaned and oiled to prevent corrosion caused by the use of the acid.

It will be found that this work, as explained, is not difficult or tedious, as it has been done with the result entirely satisfactory. In fact, small holes on any part of the roof may be tinned and soldered, but cement is preferable.

(To be continued.)

Columbia Steel Lathing.

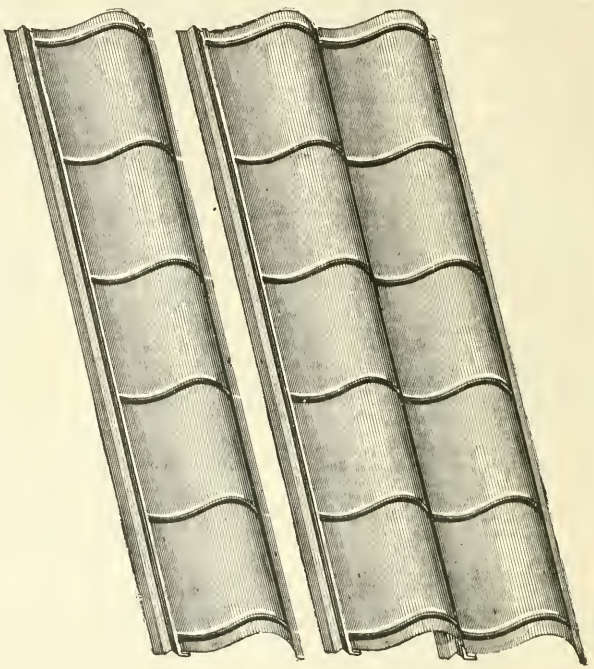
A form of fire-proof construction to which the attention of the building trades is being invited by M. H. Crittenden & Son of Minneapolis, Minn., is based upon the use of what is known as patent Columbia steel lathing nailed to metal studding composed of channel irons. The Columbia steel lath has heavy round ribs running the full length of the sheet, thus giving great strength and stiffness. These ribs are 3¾ inches apart, and between them are slots arranged with depressed lips forming an incline upon which the mortar easily slides through to the back, where it forms a lock or clinch around the strap between the depressed lips. The size of the sheets is 27½ x 48 inches. The partition is formed by the erection of sheet steel studs made of two pieces of channel or ⊔-irons placed back to back and securely riveted together. The Columbia metal lath is then nailed to this studding by the use of barbed wire nails which are driven through the lath and into the crevices between the two channels forming the studding. An idea of the appearance of the lathing when in position on the metal studding may be gathered from an inspection of the illustration presented herewith. The manufacturers state that the lath is securely held in place by reason of its rough surface and the hold which the two sides of the channel irons has upon any object forced between them. The first building in which this form of fireproof construction was employed was the Hampton Arms, an apartment house in Minneapolis, in which was placed over 70,000 square feet of curved corrugated steel floors, 32,000 square feet of patent steel ceilings lathed and 138,000 square feet of steel partitions covered with patent Columbia steel lathing.



Columbia Steel Lathing Attached to Metal Studding.

Sheet-Metal Roofing Tile.

Fred. F. Bischoff & Co., 24 and 26 West Lake street, Chicago, have brought out a new style of sheet-metal roofing tile, which is illustrated herewith. It is pressed in sections measuring 8 x 44½ inches, which are easy to lay. The construction of this tile is such that the fastening is covered with at least one inch seam lock, which, the manufacturers state, makes leakage or the rusting of nails an impossibility. Heat and cold will not affect it, as ample provision is made for the contraction or expansion of the metal. This tiling is made of the best quality of block steel, English or American tin plate, copper or galvanized iron, as required; and the firm are also prepared to furnish all necessary ridge cresting, hips and valleys. The tin and steel tile receive a heavy coat of paint, resembling the color of the original Spanish tile, making a very handsome roof. A strong argument put forth in favor of this tiling as compared with clay tiles is that the latter require double the amount of roof timber, which is an important item in the cost of building. The Texas, New York and Chinese buildings at the World's Fair, also the extensive and beautiful Fisheries Building, are covered with this tile. A fine illustrated catalogue, describing the tiling and rock-face siding, has just been completed by the firm and is now being distributed.



Sheet-Metal Roofing Tile.

FLASHINGS.

The Canton Steel Roofing Company, Canton, Ohio, have an exhibit at the World's Columbian Exposition located in the northwest corner of the Manufactures Building, Section H, where they will be pleased to meet their customers and friends. They explain, however, that on account of the fire from which they suffered and the small space assigned to them, their exhibit is not as elaborate as originally intended. The Canton Steel Roofing Company have just moved into their new plant, which replaces the works that were destroyed by fire last December.

E. T. Barnum, Detroit, Mich., has just issued a new 120-page spring catalogue, showing improved and artistic designs, covering almost every conceivable form of wire and iron work for building and decorating purposes, such as roof cresting, weather vanes, tower ornaments, iron and wire fences of every description, reservoir vases, lawn settees, chairs, statuary, wire arches and trellises, fountains, summer house, bank and office railings, grilles for interior and exterior decoration, window

guards, vault doors, balcony railings, iron stairs, columns, iron bedsteads, jail cells, stable fixtures, hitching posts, grave guards, sidewalk lights, wire signs, elevator inclosures, folding gates, &c. Mr. Barnum has been established for nearly 30 years, and is constantly adding new designs to his catalogue, which is gotten up with a view of meeting the special requirements of the trade. It will prove interesting and valuable to all who receive it, and may be obtained upon application.

BIDS will be received at the office of the Supervising Architect, at Washington, D. C., until June 9 for all labor and materials required for cut stone and brickwork, iron and wood floors, ceiling and roof construction, roof covering, skylight, &c., for the superstructure for the United States Post Office at Fort Worth, Texas, in accordance with drawings and specifications, copies of which may be had at the office of the Supervising Architect, Washington, or at the office of the Superintendent, Fort Worth, Texas.

THE VALIDITY of the new Chicago building ordinance is to be tested in the courts by the Cornice Makers' Union. This ordinance provides that bay windows and light shafts must be made of non combustible materials, and is claimed to have been passed in the interest of bricklayers and makers of fireproofing tiles. The cornice makers declare that if the ordinance in its present form is permitted to stand, several hundred men will be thrown out of work in the Chicago shops. They have employed counsel for testing the question by suit.

SEALED PROPOSALS will be received at the office of the Supervising Architect, at Washington, D. C., until June 20 for all the labor and materials required for cut stone and brick work, iron and wood floor, ceiling and roof construction and roof covering for the superstructure of the United States Post Office at York, Pa., in accordance with the drawings and specifications, copies of which may be had at the office of the Supervising Architect, at Washington, D. C., or at the office of the Superintendent, at York, Pa.

BOWERS, GALPIN & CO., Binghamton, N.Y., will not exhibit at the Chicago exposition, owing to an unfortunate mishap to their machinery, by which they were unable to get their display ready in time. They advise us that they successfully turned out a Trough 144 inches long, an achievement which they claim has never before been accomplished in seamless lengths.

A commercial writer, commenting upon the recent collapse of the industrials and the disfavor with which investors regard monopolies, says: "It is now better appreciated than at the time of their conception that these concerns were chiefly organized for speculative ends, and that the much-vaunted economies of combination were usually used as mere pretexts to aid in the marketing of enormous quantities of watered stocks."

The *Market Record* of Minneapolis indicates that the spring wheat crop may equal that of last year, and that the total crop may be expected to reach 440,000,000 bushels, with 135,000,000 bushels available for export. But at this date there are very scanty data for estimating the spring wheat crop.

Prize Competitions

$25.00.

Prize Competition No. 25.

SUBJECT:

Show-Window Display.

The subject of attractive show-window display is one requiring careful attention as an inexpensive and sure method of attracting and securing trade. This competition is designed to draw out suggestions as to the best methods of displaying goods, which may, if desirable, be illustrated by sketches and photographs. Prominent among the points which may be touched upon are the following:

1. The object of window display;
2. How this object may best be accomplished;
3. Kinds of goods especially suitable for window display;
4. The frequency with which displays should be changed;
5. Treatment of season goods;
6. To what extent goods in operation may be shown;
7. Suggestions for special and unique designs;
8. Arrangement of stands, shelving, &c., in windows;
9. Errors to be avoided in window display.

This competition will remain open until June 24, 1893.

The following prizes will be awarded:

First prize	$12.50
Second prize	7.50
Third prize	5.00

The prizes will be awarded for answers which, in the judgment of the Committee of Award, are most suitable for publication and of the most general interest

We reserve the privilege of extending the time on any competition in case the contributions received are not of sufficient number or merit for the committee to award prizes. These competitions are open to every one, and it is hoped that there will be a general response from business men. We shall have the privilege of publishing any or all of the contributions received.

Replies are to be received not later than June 24, 1893. They should be addressed as follows:

DAVID WILLIAMS,
96-102 Reade street,
New York.
Prize Competition No. 25.

The Competitions which have closed are now in the hands of the Committees of Award, who are giving careful attention to the claims of the different contributions. From the number of these and the evident merit of not a few of them, we are assured that a great deal of valuable information and suggestion will be put at the disposal of the trade.

The Weekly Prize Competitions noted below are now before our readers and remain open until the dates named:

No. 23. Closing May 27.

Three or more Subjects for Prize Competition.

No. 24. Closing June 3.

Short Methods of Figuring Discounts.

No. 20. (Reopened.) Closing June 10.

A Reliable System for Securing the Correct Charging of All Goods Sold on Credit.

No. 25. Closing June 24.

Show-Window Display.

Another subject will be announced in our next issue.

OBITUARY.

N. B. HUSSEY.

Those who have attended the meetings of the National Association of Master Plumbers will be shocked to learn of the death of N. B. Hussey of Omaha, Neb., whose face was a familiar one at the conventions. Mr. Hussey, who died at Omaha on May 11, was born at Freedom, Maine, in November, 1836, at which place he resided until 12 years of age. He then removed with his parents to Springfield, Mass., where he remained eight years and laid the foundation of his education. Then going to Boston and completing his education, he returned to Springfield and engaged in the insurance business, which he followed during the next two years. He then took charge of the interests of the Connecticut River Railroad at Northampton, where he remained 12 years.

At the end of this time he engaged in the steam-heating and hardware business in Northampton and eight years after in the work of building waterworks systems for cities, putting in plants at Holyoke, Northampton and Florence. His health failing, he removed in 1882 to Minneapolis, Minn., and in 1886 to Omaha, forming here the Hussey & Day Company, of which he was president until the day of his death.

For the past five years he has been president of the Omaha Master Plumbers' Association and for the past three years president of the Builders' and Traders' Exchange of that city. He was also a member of the Executive Committee of the National Association of Builders, and was quite prominent in politics as a member of the Republican party. He had also been, when in Massachusetts, a member of the National Republican Committee. He was married in 1857 to Margaret Bliss of Northampton, Mass., who survives him and by whom he had five children, three of whom are living.

According to a London journal, the results of the official surveys recently made by order of the Government of Japan show that the coal fields in the island of Yezo are likely to prove of great commercial and industrial importance to that country. The workable coal beds are estimated to contain at least 150,000,000,000 tons, or about two-thirds as much as those of Great Britain. The coal hitherto obtained is of somewhat uneven quality, but is declared by the British consul to be "all marketable."

WORLD'S FAIR NOTES.

A Whaleback Passenger Boat.

Capt. Alexander McDougall's scheme, which was thought chimerical when announced, has been realized, and a great passenger whaleback now runs on Lake Michigan between the business center of Chicago and the World's Fair docks. It is named the "Christopher Columbus." It arrived at Chicago on the 18th inst., making a speedy trip from West Superior, where it was launched. The "Christopher Columbus" is the first passenger whaleback ever built. Besides this, it is the longest vessel seen in the port of Chicago. It was built for lake service in a lake shipyard, and is the perfection of a new idea in shipbuilding. A few years ago Captain McDougall evolved his whaleback idea and freight steamers were successfully launched. The new vessel looks almost as queer to modern eyes as the old high-decked vessels of Columbus' time. Three decks rise above the whaleback and tower in the air like the circles in an amphitheater. The vessel was begun September 6, 1892, and completed and launched December 3, 1892. The monster steel cylinder is 362 feet long, with a beam of 42 feet and a depth of 24 feet. Triple-expansion engines with three cylinders, 20, 24 and 70 inches in diameter, lie in the torpedo-like steel shell. With 2600 horse-power the whaleback rides the waves at the rate of 20 miles an hour. During the voyage to Chicago the vessel went at the rate of 18 miles an hour. Heavy seas were met on the trip. The whaleback did not cut through them, but rode over them. The bottom of the cylinder has nine water-tight compartments for a water ballast of 730 tons, which serves to keep the vessel in an upright position. Seven turrets support the decks. There are five decks altogether, including the main, the promenade, the turret and the hurricane. In the cylinder is another deck, where the restaurant and dining room are to be managed.

Along the promenade deck runs the grand saloon, 225 feet long by 60 feet wide, with a ladies' cabin aft. The saloon will likely make passengers forget that they are riding on the lake. The apartments are handsome and luxurious throughout. No one could wish for a prettier room. Cushions soft and easy cover the chairs, the decorations are artistic, and the view from the windows superb. In the center of the saloon rises a fountair which trickles down a crystal globe into an aquarium below. On the windows designs of ships, from Noah's ark to the whale back, are engraved. The captain's cabin, the wheelhouse and the officers' quarters are on the promenade deck. Everything is painted white down to the water line.

The arrangement of the decks above the cylinder is unique and gives the seasick passenger a sense of comfort and safety which is absent on other big passenger boats. One can stay far out of reach of the waves and breathe the fresh air freely. Passengers are not huddled together below deck in a stuffy atmosphere and within sound of the waves as they dash against the sides of the vessel. The waves of Lake Michigan will have free access to the deck of the cylinder, but they will hardly climb higher.

New and Old Tracks.

An important attraction was added to the exposition last week by the opening of the exhibit of the Pennsylvania Railroad Company, which is an independent feature located between the Hygeia Building and Cold Storage. A number of prominent railroad officials were present and an abundance of handsome bunting was unfurled, but there were no formal ceremonies.

The space assigned the Pennsylvania Company is 400 x 150 feet, and the exhibit is partly outdoors and partly housed in the main hall, 100 x 40 feet in size, of a model railroad station, 140 x 40 feet in size, built of staff and of classical and beautiful architecture. The exhibits relate only to the transportation lines comprising the Pennsylvania Railroad system, and its design is not only to perpetuate the early history of the lines merged into or associated in interest with the Pennsylvania Company, but also to place permanently on record the results that have attended the efforts of the management's advanced methods.

One of the outdoor exhibits is a section of a four-track standard railroad, 100 feet in length, laid with standard 100-pound rails, or 3333 pounds to the rail, with frogs, switches, stone ballast, ditches, signals, and overhead foot bridge. The rails are 100 feet in length. The track is ballasted with crushed stone and drained on each side by drains made of concrete. The signal tower is equipped with a special Westinghouse electro-pneumatic machine, which controls the two switches and six signals governing the track.

On this splendid track and in strange contrast with it, is exhibited the old locomotive "John Bull," with pilot and tender complete, which was first put in service on the Camden & Amboy railroad November 12, 1831, and which is the oldest complete locomotive in America. It was still able to haul to the exposition the two Camden & Amboy passenger coaches of the style of 1831, leaving New York April 17 and arriving in Chicago April 22. On the track are exhibited also the two special gun cars on which the two huge Krupp guns of 10 inch and 16½ inch bore were transported. The guns weighed 140,000 and 285,000 pounds respectively and the gun cars 113,300 and 175,000 pounds, making totals of 253,300 and 460,000 pounds. Reproductions of the guns are mounted on the gun cars.

Still more interesting, if possible, is a collection of old railroad material sent in a special car from the Smithsonian Institute in charge of J. Elfreth Watkins. It consists of a number of specimens of articles in use as far back as 1830 or 1831. Old signals, wooden engine and car wheels, strap rails, and primitive switches and crossings are exhibited, but the most interesting article is a section of track laid in 1831 on the Camden & Amboy Railroad. The rails are about the size of those used in mines for small hand cars. The ties are blocks of granite about 2 feet wide, laid three to each rail. The stone sleepers are provided each with two holes, or, when they come at the joint of two rails, with four holes. In these holes were driven locust wood plugs and the rails were fastened down by spikes driven into the locust plugs. When they fastened a rail in that way in 1831 it was expected to stay. The rails themselves were held together by single fish plates at each joint, to which they were riveted with hot rivets. This was to make the track very rigid, the possibility of rails wearing out never occurring to railroad men in 1831, since at that time none had ever given out.

These valuable relics of some of the first railroad work done in this country will be returned to the Smithsonian Institute at the close of the exposition.

The indoor exhibit consists of: 1, panels, relief maps and charts; 2, models; 3, canal boats and appliances; 4, special machinery; 5, monuments; 6, safety appliances, precautions and uniforms; 7, floating equipment; 8, switches and frogs; 9, tracks and signals; 10, bridges; 11, relics, numbered from 36 to 762, in cases; 12, relics, numbered from 373 to 463, in frames; and 13, views on the Pennsylvania lines, numbered from 2529 to 2590.

Another Disagreement Over Awards.

The agricultural machinery exhibitors at the exposition wrestled with the question of awards at the Grand Pacific last Friday night. H. C. Staver of Chicago, president of the Chicago Vehicle and Implement Club, presided. John Boyd Thacher, chairman of the Executive Committee on Awards, explained the methods of judging. There would be no graded prizes. Every meritorious exhibit would receive a medal and accompanying diploma. There was no fund for field trials of agricultural implements. The judging would have to be done on the floor.

Mr. Manning of Syracuse, N. Y., said that the plow exhibits were not ready for field trials, and judging on the floor was an absurdity.

Colonel Dodge of Dixon, Ill., as a representative of the Western Plow Association, protested against any awards whatever, declaring that no man could be secured competent to pass upon plows.

Mr. Robie of Indiana declared there was not a man on earth competent to pass on engines and thrashing machines on the floor.

After Mr. Cox of Illinois suggested that exhibitors could withdraw from the judging, a discussion was had as to the advisability of all withdrawing. A vote showed 20 for withdrawal, 15 against, and 25 not voting.

Chief Buchanan of the agricultural department suggested that the various lines represented get together and agree upon what plan they should pursue. Unless all stood out of the judging he would be compelled to report to the judges those who desired to stand for the awards.

Hon. James Martin, M. P., and special commissioner from New South Wales on machinery and agricultural implements, then addressed the meeting by invitation, and complimented the American agricultural implement exhibit as a revelation.

A committee consisting of Messrs. Manning, Cox, Farie, Bevington and Francis was appointed to report at another meeting, to be held at the Grand Pacific next Friday night, a form of permanent organization for the agricultural implement exhibitors.

The Photographic Concession.

The representatives of trade papers and other illustrated periodicals have been seriously inconvenienced by the restrictions placed on them in securing photographs of exhibits. They have been obliged to apply to Official Photographer Arnold for all work in this line. A slight loophole was offered in the way of making special photographs by a rule permitting small hand cameras to be carried on the grounds at a tax of $2 each per day, to be paid to the official photographer. Complaints of high charges and slow service rolled into

headquarters, until finally the National Commission made the matter the subject of official inquiry. The Special Committee appointed last week to inquire into the concession of Mr. Arnold, the official photographer, made its report on Friday. Members of the committee said that no records of the concession had been found in the Director-General's office, and it was a puzzle to them when Arnold and his partner got the authority to levy a tax on persons carrying cameras in the grounds. The following resolutions were adopted:

That all publishers of illustrated papers or periodicals shall be permitted to send their photographers or artists upon the exposition grounds and in the exposition buildings to take pictures for publication in their respective papers or periodicals under the rules already adopted, provided that said pictures shall be used for no other purposes.

That when publishers elect to employ Mr. Arnold, the official photographer, to make negatives for them they shall be made at a reasonable price without unnecessary delay, and that said negatives shall be the property of said publishers after they have paid for them and shall be in their possession, provided, however, that neither of the said negatives nor any print therefrom shall be used for any purpose other than for publication in the periodical or paper for which it is made.

That the Director-General is hereby directed to enforce the rule adopted by the commission and found upon page 138 of the official minutes of the seventh session of the said commission, which is as follows: "Sketches, drawings, photographs and other reproductions of articles exhibited will be allowed only upon the joint assent of the exhibitor and the Director-General. But photographs may be taken upon the grounds and general views of portions of the interiors of the buildings may be made by the approval of the Director-Geueral."

The committee was not discharged, but instructed to learn all possible about the photographic concession and report at its earliest convenience. There is now some hope that the fine exhibits at the fair can be adequately shown in periodicals. The difficulty of securing prompt service and the high cost of the official photographs were serious impediments in the way of securing desired illustrations.

Increasing Attendance.

Fine weather last week served a twofold purpose. It greatly increased the attendance and decidedly hastened the work of getting the grounds and buildings in better order. Although there are plenty of exhibits in every department which are not yet in proper shape and may not be for two or three weeks, the exposition is now well worth viriting. It will be necessary for visitors to bear in mind that some of the States have exhibits of a most interesting character in their own special buildings. Many things are likely to be overlooked on this account, merely because they are not in the principal exposition buildings. The rate of admission for children was fixed the past week at 25 cents for those 6 to 12 years old, while those under 6 are admitted free.

A new market is said to be likely to open for the slate trade. The report comes from France of the discovery that slate makes an excellent electric insulating material, numerous experiments proving, according to a well-known French technical journal, that the substance can in many cases replace such expensive insulators as glass, porcelain, ebonite, vulcanite, &c.

An electric towing vessel has recently been put into operation on the river Seine, near Paris, with marked success. A magnetized pulley of novel design is used, for which great efficiency is claimed.

New Publications.

VENTILATION AND HEATING. By John S. Billings, A.M., M.D. Published by the *Engineering Record*. 1893. Price $6.

This book of 500 pages, with its 210 illustrations, must at once take rank as the most comprehensive American work upon the subject. Written, as it is, for the architect, engineer and non-professional man, the author has, upon the one hand, avoided a treatment too scientific, and on the other, has made his descriptions and explanations perfectly simple, without rendering them wearisome to the technical mind.

An introduction upon the utility of ventilation is followed by an exceedingly interesting chapter on the history and literature of the subject, with which is incorporated a list of the more important works relating to ventilation, dating from the earliest in 1714. The atmosphere, its composition, physics and humidity, the tension of vapors and the effusion of gases, are treated in chapter 3, followed by a long dissertation upon carbonic acid, accompanied by what must impress the ordinary reader as an excessive number of separate reports of air analyses. Neither the utility of ventilation nor the efficiency of the means employed can be clearly appreciated without an understanding of the physical and chemical aspect of respiration. The pages given to this division of the subject are most comprehensive and treat also of organic matter, bacteria, offensive and dangerous gases and dust in the air, as well as of sewer and soil air.

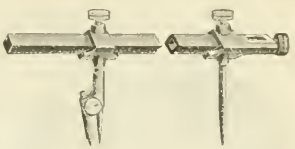
The relation existing, between moisture in the air and successful heating and ventilation is one not usually comprehended, although here clearly explained. The matter of actual quantity of air required for ventilation always stands open for discussion, and Dr. Billings will always be found urging increased air supply; for no one appreciates more fully than he how far is the large majority of the buildings of this country from a condition of healthful ventilation. His opinion of the commonly accepted basis of school house and similar ventilation, viz., "30 cubic feet per person per minute is definite and decided. He writes: "Thirty cubic feet of air per minute in rooms continuously occupied, will not secure good ventilation; nor is an architect or engineer justified in preparing plans upon the basis of such an amount of supply." Further on he shows the desirability of 45 to 60 cubic feet per minute.

A treatise upon the action of aspirating flues and chimneys, the laws governing the same, the influence of accellerating coils, fans and blowers, together with a description of the apparatus and methods of testing air velocities and volumes, and the determination of the presence of carbonic acid, combine to form chapters 8 and 9; while the succeeding chapter is given up to a very complete exposition of the methods of heating. Stoves, furnaces, fire places, steam and hot water systems are all presented with numerous illustrations.

That the source of air supply, its filtration and its proper tempering are of utmost importance, is clearly indicated by what follow, while the chapter upon foul air shafts and outlet cowls dispels some popular fallacies regarding the efficiency of many chimney and vent flue tops. Some interesting cuts of ancient methods of fan construction and mine ventilation are presented in the chapter on mine ventilation, in connection with a table of tests upon mine fans. The remainder of the book, 250 pages, is devoted to very complete descriptions, with excellent illustrations of actual examples, of systems in operation in various classes of buildings. The hospital, with its absolute requirements of the very best in the way of ventilation, is dealt with most exhaustively, while legislative halls, theaters, churches, schools and dwellings are discussed in as many chapters. A chapter on the ventilation of tunnels, railway cars, ships, prisons, stables, shops and sewers, closes the work. The remarks upon shop ventilation are certainly open to criticism, in that no reference is made to the present common method of shop heating and ventilation by the blower system. Throughout, the subject is treated in an extremely simple and straightforward manner, devoid of evidence of bias, and in just the comprehensive form desired by the inquiring mind, no matter what its previous knowledge. A very complete index adds greatly to the value of the work.

Draftsmen's Trammel.

The accompanying cut represents a tool recently put upon the market by Hurley Brothers, 223 State street, Hartford, Conn. The trammel is designed for the use of pattern makers, draftsmen, &c. The tool is 14 inches in length, well finished and nickeled, and



Draftsmen's Trammel.

is referred to as having a beam of square brass tubing, which is very light, and points made from best tool steel and hardened; it also has a pencil attachment. The makers remark that after placing the attachment in the same radius as the steel point it can be changed from one radius to the other without changing the relation of one to the other. Attention is called to the fact that the points can be set approximately when brought down with fine adjustment at the end. At an additional cost an extension of 14 inches with a clamp is furnished when desired.

It is estimated that the capital invested in American natural-gas fields amounts to over $100,000,000. The following notes collected by a statistician as to the development of the use of this fuel are of interest: In 1821 natural gas was first used for illumination in Fredonia, N. Y.; in 1838, for heating purposes, at Findlay, Ohio; in 1841, for salt making, in West Virginia; in 1860, for steam production, at Oil Creek, Pa.; in 1870, for domestic fuel, shore of Lake Erie; in 1873, for iron making, at Leechburg, Pa.; in 1883, for plate-glass making, at Creighton, Pa., and in 1883 it was first piped for general supply in Pittsburgh. Natural gas was discovered in large quantities at Findlay, Ohio, in 1884, and in 1886 the large fields of Central Indiana were first hit upon.

COPPERSMITHING.

Art of Coppersmithing.

XLII.*

DYERS' COPPERS.

Dyers' coppers, as compared with some others, are not a difficult job, which will be readily seen by referring to Fig. 466. A dyers' copper is made with a cylindrical body and a segment of a sphere for a bottom. The sides are usually made in two pieces, and the bottom in one. These coppers may be made with a broad or narrow brim, similar to that of a tallow copper; or they may be supplied with a lead apron to catch and convey the drip and slopping, which is always a contingent circumstance in the dyers' art. Let us make a dyers' copper to hold 150 gallons' American standard. Now, we have learned by experience that the easiest way to build this vessel is to make the bottom one-fourth the depth and the sides three-fourths, without the brim, although this, like all others, may be made any style or shape to suit the taste or convenience of the purchaser. But we will suppose the sides needed are three-fourths the depth and the bottom one fourth. An American gallon equals 231 cubic inches, and 231 × 150 = 34,650, or the number of inches in 150 gallons, and we have 0.7854, which represents a cylindrical inch; then $\frac{0.7854}{4} \times 3 = 0.58905$, or $\frac{3}{4}$ cylindric inch. The value of a segment of a sphere whose hight is one-fourth its diameter is 0.08181, and adding this to the value of $\frac{3}{4}$ cylindric inch we have 0 58905 + 0.08181 = 0 67086, the value of the figure which represents a dyers' copper. Then 34,650 ÷ 0.67086 = 51,649.964, and extracting the cube root of this last result we have

37.3 as the diameter or $\sqrt[3]{\frac{34650}{0.67086}} = 3.73$; that is to say, $37\frac{3}{10}$ inches is the diameter of the sides, and $\frac{37.3}{4} \times 3 = 27.975$, or 28 inches is the depth near y, without seams, and $\frac{37.3 \times 3.1416}{2} = 58.5858$, the length of one side. Add to each side say $2\frac{1}{2}$ inches to the length before hollowing. We are now ready to hollow the bottom, mark and punch it, also to prepare the sides for putting together in the same way. In the building of this copper we may use cast or wrought rivets; let us use cast. I should here state that the sizes of cast rivets are designated the opposite way to that of wrought; that is, No. 0 is the largest size in wrought rivets, which run from 0 to 8, while 8 is the largest cast rivet, which run from 8 to 0. Fig. 467 shows the shape and sizes of both wrought and cast. (We usually call the wrought ones nails to distinguish them from cast rivets.) Take the bottom and wrinkle it regularly around the edge; then sink it in the hollowing tub, and work out the wrinkles carefully until the diameter is the size required; smooth up and planish. Now work and punch the sides and bend them to shape, and put three temporary rivets into each seam; then with a racer mark off the depth of the brim and run around it with a hammer, Fig. 468, to harden it at the turn, and then lay off the brim. Draw in the other end at the sides to fit the bottom, Fig. 469, and planish the sides on the horse shown in Fig. 470, and work in the seam rivets. Scrub and finish the seam, making the surface of the seam inside smooth. Mark and punch the holes for the bottom seam, after which set the sides into the bottom evenly all round, and mark the holes in the bottom by the sides, and punch the bottom. Put the sides back in the same place, and put into the bottom seam a few temporary rivets.

ART OF COPPERSMITHING.

for seams, and we have 58.5858 + 2.5 = 60.0858, which we should call in practice 60 inches. Now, we must add 3 inches for the brim, and we have 27.975 + 3 = 30.975, or 31 inches nearly. Let the sides be 60 inches long and 31 inches deep. The bottom is obtained as follows:

$$\frac{1}{4} \ 37.3 \times 12.325 \times 4 = 42.88;$$

that is to say, the diameter of the copper multiplied by one-fourth the hight, together with 3 inches added for the bottom seam, multiplied by four, and the square root of this last result is $42\frac{7}{8}$ inches, or the diameter of the bottom

Now work them in all round the bottom seam, performing the work on the horse. When they are all in, scrub them up tight until the inside is smooth, after which head up the rivets outside and finish.

TIECHES.

Sugar tleches were made the same as a tallow copper, excepting that heavier material was used, and the brim usually made narrow, as shown in Fig. 471. They can now be made in one piece, but where this is not possible the same rules and directions given for tallow coppers may be used, and will be found

as useful for fleches and all other vessels of this shape, as for tallow coppers, due allowance always being made for seams, as suggested in the directions given.

STILLS.

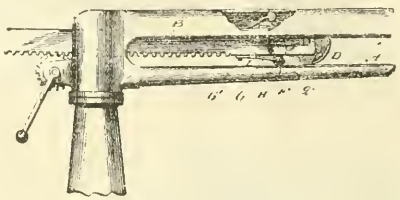
Copper stills are and have been in continual demand for many years and are likly to be, seeing that there are so many uses to which they may be put in the manufacture of the many commercial commodities which depend upon the process of distillation. Stills are made from 1000 to 5000 gallons capacity, according to the uses for which they are required. The largest, however, are used for the purpose of distilling spirits, such as gin, rum, and brandy. These large stills will occupy our attention. In Fig. 472 is shown a squat or fire still with head and worm. This apparatus is usually made in three sections—that is to say, the still boiler, the head, and then the worm, which together complete the still proper. But they are often supplemented with retorts of various designs, the most common of which is shown in Fig. 472. These retorts are used for rectifying purposes, and there are sometimes several interposed between the still and the worm, according to the degree of rectification required. As all large stills are made nearly the same pattern, we will make one as an example or guide for ascertaining the dimensions and pattern of those most in use and then consider their construction. Let our example be required to hold 500 gallons. It will be seen by reference to Fig. 472 that the outline or design of the body of the still boiler is that of an oblate spheroid—that is, down to the lag of the bottom, when the bottom is reversed or pressed upward to form the bottom crown in the same way as that of a brewing copper. Here, in the case of a still, as in a brewing copper, the quantity displaced by the crown of the bottom is quite an item in the capacity and must therefore be taken into account, although it was ignored in the case of large brewing coppers. Our body, then (that is, the boiler), is to hold 500 English gallons. Now, we find the solid contents of a spheroid by multiplying the square of the revolving axis by the fixed axis and this product by 0.5236. Here, then, we have the key to the solution of the various problems involved in the sizes or dimensions we should make the still boiler, and we will proceed to find the diameter and hight of a still boiler to hold 500 gallons (English measure), to be used as a rule to find any or all others. An English gallon contains 277.274 cubic inches, therefore $500 \times 277.274 = 138,637$. Again, in an oblate spheroid whose dimensions are fixed in the proportions shown in Fig. 473—namely, two and a half diameters of the focal circles A and B as the measure of the transverse axis of the ellipse which forms the outline for or boundaries of the spheroid, and whose axis is C D, or is 1—the value of its solidity is found by the rule given to be 0.29362. The spheroid, however, is made concave on the under side to form the lag and crown of the boiler bottom, therefore this value must be reduced by the value of the spherical segment E G F, Fig. 474, which vanishes, together with the segment E H F, which forms the bottom crown. Now, $\overline{EK}^2 \times 3 + \overline{GK}^2 \times GK \times 0.5236 = 0.02758$, the solid content of the segment H E F, and $\overline{EK}^2 \times 3 + \overline{HK}^2 \times HK \times 0.5236 = 0.02128$, the solid content of the segment E H F, or the segment which forms the crown of the boiler bottom; then subtracting the value of these two segments from the whole spheroid we have $0.29362 - (0.02758 + 0.02128) = 0.24376$, or the value of solid figures whose dimensions are similar to or like that of a still boiler. To proceed: The solid contents of 500 English gallons is shown above to be 138,637 cubic inches; then $138,637 \div 0.24376 = 568.743.805$ boiler inches, and extracting the cube root of this last result we have 82.85 inches as the diameter C D of a still boiler to hold 500 gallons. Now we want the depth, H N, Fig. 474, which we find by multiplying the transverse axis C D, or 82.85, the diameter of the boiler, by 0.3701; that is to say, C D by H N, or $82.85 \times 0.3701 = 30.6627$. We thus have the diameter of the boiler, 82.85, or 6 feet 9 inches, and the depth from the bottom crown to the head collar, 30.6627, or 2 feet 6⅝ inches. For the pattern proceed as follows: Through S F and T E, Fig. 474, draw the lines S P and T P, and with P F as radius describe the arc F M, and with P S as radius describe the arc S O, making the distance from F to S equal to 26.028; that is, 82.85 multiplied by one-fourth of the circumference of the focal circle. The length of each one of the sides from F to M may be any convenient length, according to the size of the sheet; but for the symmetry and beauty of the work, the sides should be all alike; that is to say, either three, or four, or any other suitable number, so long as they are all alike or can be got out of the sheets at hand without waste. Now take sides enough so that when they are put together they will measure 83 inches in diameter at the points C and D after the top and bottom have been tucked in to form the bulge or curve of the sides, and let the sides, when ready for the bottom, go into the raise of the bottom within about 2½ inches of the bottom lag. The first section of the crown from S to B, Fig. 475, may be made in the same number of pieces as the sides if it cannot be supplied in one piece with the bottom, but the crown pieces are usually supplied. Having then the sides, bottom and crown, the workman may proceed to put them together in a similar manner to that described for the building of large brewing coppers. I should here say, it is sometimes better to cover the trestles with boards of a suitable thickness (if at hand), which will add firmness to the trestles and make the stage more complete. The illustration, Fig. 472, fully explains itself as to the construction of the still head and worm, while the processes or methods used to make them have been explained in a former chapter and need not be repeated.

[THE END.]

At 1518 Chestnut street, Philadelphia, a company known as the Associated Art Workers have opened an establishment for the exhibition of a combination of skill in general decoration, furnishings, &c., as shown in the complete equipment and furnishing of the building as a residence. The handsome furniture and artistic decorations cover the latest styles and effects, and include many novelties. The bathroom attracts particular attention. The bath is constructed of enameled art tiles, cream-colored, and is fitted with polished brass fittings. A Mexican onyx open washstand with oval basin and a syphon closet with bird's-eye maple tank and fittings complete the furnishings of the room. The wainscoting, 5 feet 6 inches high, is of white tiles with a border of glazed art tiles, festoon design. The purpose of the company is to undertake contracts for the decoration and furnishing complete of any class of building, private or public, and in every style.

Groover Attachment for Smoothing Seams.

Fred. Kanzleiter, 523 N. Lafayette avenue, Terre Haute, Ind., is introducing an attachment to be used in connection with seaming machines, more commonly known in the trade as grooving machines. The object sought is to provide a simple and cheap attachment, which the maker says may be readily applied to any groover now in use, for smoothing down a seam after it is formed at one and the same operation, avoiding the necessity of afterward hammering it down. The device consists of a spring arm carrying a supplemental roller, the arm being held against lateral movements by simple means, the supplemental roller traveling in the path of the seaming roller, interfering in nowise with the successful operation of the other parts.



Groover Attachment for Smoothing Seams.

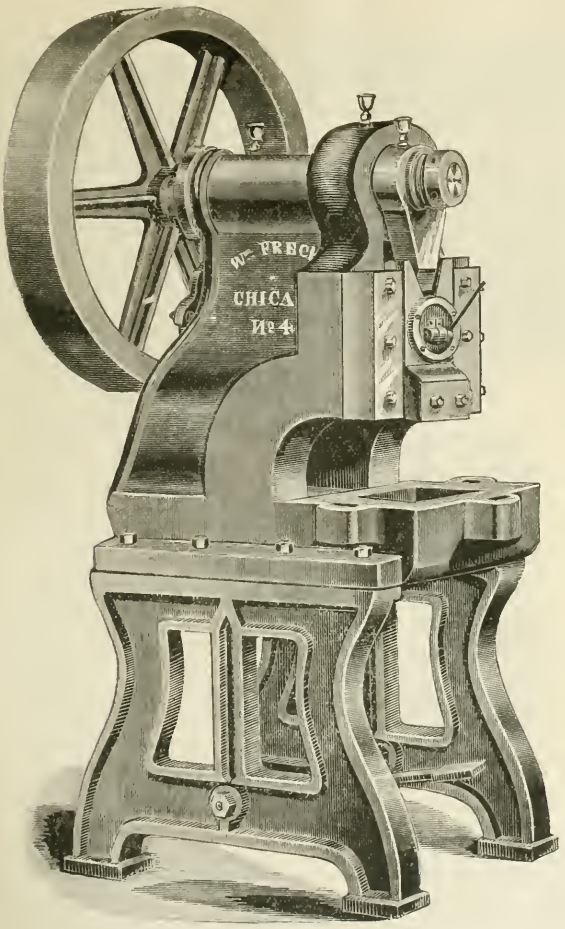
Three of the most powerful ships in the Russian navy will soon visit New York. Two are ironclads, which have a displacement of from about 8000 to 9000 tons, and each cost $3,000,000 or upward. They are the battle ships "Admiral Nachimoff," "Nicolai I.," and the armored cruiser "Pamyat Azova."

An interesting fact concerning the relative hardness of copper and zinc has been brought to light by means of Paul Jannetaz's new sclerometer. Most authors regard zinc as harder than copper. If, however, the metals are examined in a sufficiently pure state, it appears that copper is the harder of the two.

Assistant-Secretary Hamlin has decided that terne plates manufactured from imported or smoothed or cold-rolled black plates are entitled to drawback allowances.

The Frech Punching and Forming Press.

Among the more recent improvements in this class of machinery is the press built by the Frech Machine Company, 75 and 77 West Van Buren street, Chicago. As shown in the perspective cut—from photograph of the No. 4 machine the general features of design embody the two essential qualities of strength and convenience in operating. The depth of throat permits the handling of wide sheets, while the arched opening through the base of the housing allows the passage of sheets lengthwise to a width not exceeding 13 inches. The bottom plate of the housing is securely bolted to the supporting frame, which is made very heavy and affords a large amount of supplementary strength and rigidity to resist the springing tendency from working the machine at its maximum capacity. The housing is made solid from the top of the opening to the crank-shaft bearing, the latter being heavily ribbed at the crank end to resist the tensile strain of the working stroke. No bushings are provided for the journal bearings of the shaft, they being formed of the cast-iron surfaces, lapped perfectly true and smooth, and the shaft journals ground to fit. Owing to the close grain of the quality of iron used in the casting and the large amount of bearing surface, the accurate fitting of the journals remains intact for an indefinite time, as no appreciable lost motion is caused by several years' continuous use. The shafts are of hammered steel and of large diameter—the latter, of course, being proportionate to the stroke of the head—and the crank-pin is turned down from the solid metal. The size of the shaft used with the No. 4 machine is 6 inches diameter for 1¼-inch stroke, thus permitting the diameter of the crank-pin to be 4½ inches. In the actuating device there are no peculiar features, the engagement of the shaft and its automatic release at the end of the up-stroke being by means of the treadle operating the ordinary pin-clutch.



THE FRECH PUNCHING AND FORMING PRESS.

The most important feature of the machine, which has been made the subject of a recent patent, is in the method of adjusting the stroke of the head—or, more specifically, the device for maintaining the adjustment.

The Trimo Combination Wrench.

Trimont Mfg. Company, Amory street, Roxbury, Mass., are introducing the above tool, as herewith illustrated. It is made with a long sleeve nut and oval threads, the latter being a feature common to all Trimo wrenches. When used as a nut wrench the thumb nut is tightened, which does not interfere with adjusting the jaw to the size of nut, but obviates all play or looseness of the movable jaw upon the bar. When used as a pipe wrench the screw is loosened, thus giving the movable jaw perfect freedom to take hold and release. When releasing the pipe it is not necessary to unscrew the wrench, as it releases as soon as the pressure ceases. The pipe side of the movable jaw has a toothed piece held in place by a pin, which can be replaced when desired. The manufacturers claim that the wrench does not slip, lock, or crush the pipe, and that it performs the office of a nut wrench equally as well, combining simplicity and strength with quickness of adjustment. The wrench is interchangeable in all of its parts and designed to meet the wants of machinists, engineers, mechanics, &c. The wrenches are made 10, 12 and 15 inch, to take pipe from ⅛ to 2 inches.

The Trimo Combination Wrench

New methods of separating tin from scrap have been announced from numerous quarters lately, and several of these have been noticed in *The Metal Worker* from time to time. Here is a process for which a patent has been secured by J. and C. Batchelor of Penarth, Wales: These inventors find that tin can be cheaply and effectually separated from iron or steel tin-plate scrap by means of an electric current in a suitable bath, provided the solution be rich in tin and a low voltage be employed. To send a sufficiently large current of electricity through the bath, and, at the same time, keep the voltage low, the scrap tin is formed into anodes by compressing it in a mold and to such a density that it retains its form when removed, but is not so dense as to impede the action of the electricity in the solution employed. The anode slabs are preferably made from 3 to 6 inches thick, so that the voltage shall not rise—owing to the distance of the center of the scrap anode from the cathode—to much more than the counter electromotive force produced by the baring of the iron at the points nearest the cathode plates, thus preventing the iron becoming dissolved before that portion of the tin which is furthest from the cathode.

THE LETTER BOX.

Warping of Sheet-Iron Pans.

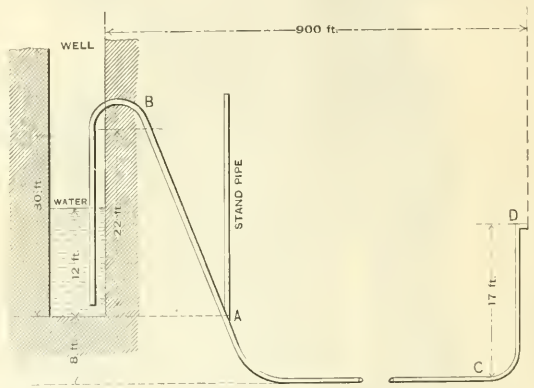
From F. J. H., *Rochester, N. Y.*—Some time since I had occasion to make a number of sheet-iron pans for a bakery. The pans were made of No. 24 smooth iron, 18 x 25 inches in size and $\frac{3}{4}$ inch deep when finished, with a $\frac{3}{16}$ rod in top. The baker claimed the pans were not properly made, as when they were put in the oven the heat caused them to turn up at the corners, so it was impossible to bake in them. He informed me that in England, where he came from, the pans would never act that way, but lie perfectly flat in the oven, the heat not causing them to warp. Will some of the readers of *The Metal Worker* who have had experience in the manufacture of such pans inform me how to remedy the difficulty?

Galvanizing Corrugated Iron.

From W. T. FLANDERS, *Nashua, N. H.*—In answer to the inquiry from "W. J.," Bay City, Mich., in *The Metal Worker* of May 13 as to how to prepare and galvanize corrugated iron, I will submit the following, which will be found practical for the purpose where the amount of work is limited. I would not, however, advise any one to engage in the business unless he had sufficient work to employ at least one skilled man, as galvanizing cannot be done cheaply except by one having a large amount of work. The kettle should be of refined iron (fire-box iron is best in my opinion, although many galvanizers use steel) and of sufficient length and depth to immerse the sheet completely and allow a few inches at the bottom for the dross to settle. The bath should be of pure spelter or scrap zinc. No tin is required or used in the business. Great care must be taken that the metal does not get overheated or burned, as such a condition would injure it and cause loss. Practice alone will enable one to determine the proper heat necessary for the different kinds of work, as a kettle heat to galvanize cast iron would not answer for sheet iron, and so it is in galvanizing different qualities of sheet iron—the heat of the metal must be gauged with reference to the work to be run through. The sheets should first be cleaned of scale by immersing them in a pickle composed of 5 parts water and 1 part sulphuric acid. Care must be taken that the sheets do not remain in the pickle long enough to become burned or over-pickled. Any particles of scale which the pickle does not readily eat away must be removed by scouring with sand or by picking out with a sharp steel. The shank of an old file ground sharp will answer. The sheets should then be rinsed in water, then dipped in a solution composed of 3 parts water and 2 parts muriatic acid, after which they should be dried. They are then ready for dipping. The last-mentioned solution is identical with muriate of zinc, used by tinsmiths in soldering, and causes the zinc to adhere to the iron. Care must be taken that the iron does not get burned in the drying. For example, the sheets should show a grayish color when dry; if they are burned they will be a dark brown and will not readily take the zinc. On the other hand, if the acid is too weak the iron will dry red, in which case the zinc will peel from the iron or refuse to adhere at all. The pickling or acid tanks should be made of pine, and so constructed that the acid will not come in contact with the iron fastenings.

Difficulty With Syphon.

From J. H. W., *Pine Bush, N. Y.*—I have a well 30 feet deep in which there is 12 feet of water, and the water is conveyed 900 feet through a pipe arranged as a syphon. As shown in the accompanying drawing from bottom of pipe to where it leaves the well is 22 feet, and from bottom of well to run of pipe is 8 feet. From the pipe C to outlet D is 17 feet. When the pipe was first put in, the water would hardly



Difficulty with Syphon.—Connecting Stand Pipe, Suggested by "J. H. W."

run out at C. Accordingly a T was placed in the pipe at the point A, which is level with bottom of well, and a stand pipe connected which extended 3 feet higher than point B, where the pipe turns to leave the well. After doing this a pump was connected with the stand pipe and the air exhausted from the main pipe. The water then commenced to run through the pipe and out at opening D.

Note.—From an inspection of the diagram submitted by our correspondent it would appear that the outlet D is only 3 feet below the surface of water in well. If such is the case, the flow of water at D must be very limited. There appears to be no particular reason for connecting the stand pipe at A, as the air would naturally collect at the highest point in pipe, which is at B. Then this would be the most favorable point for connecting the stand pipe. It is supposed this pipe is provided with a stop cock, so that when the air in the pipe is exhausted by means of the pump the stop cock can be closed, thus preventing any air from entering.

A Tin Plate Growl.

From G. S., *Laura, Ohio.*—In reference to an article in *The Metal Worker* of May 6, on the subject of Welsh tin plates, would like to say that I have been using these plates several years, but have not noticed the falling off as being so great until recently. That which I have received lately is irregular in thickness and very greasy. On counting the sheets, too, I find the boxes contain only 111 instead of 112, as formerly. I would like this to be published for the protection of brother tinners, and would ask that if anything of the kind comes to their notice they would write it up. I think this is a plan they have been trying in order to compete with American plates. I prefer the domestic tin and think it to be far superior to any Welsh tin I have used. I have used large quantities of Calland IC and IXX bright. Of the latter I have made coffee pots and buckets, thinking they would give good results. To my sorrow I have found them giving way in from six months to one year. There does not seem to be enough coating. I think if we could get plates coated as in former years we should avoid the pin hole trouble.

Size of Syrup Dippers and Skimmers.

From W. S. C., *Tallahassee, Fla.*—Will some reader of *The Metal Worker* inform me what size to cut syrup dippers and skimmers?

Leaking Gutter.

From H. & J., *Harlan, Ind.*—Is it possible to line a gutter with metal so that it will not break? We lined a gutter on a house, using a guaranteed terne plate. The seams were soldered on both sides and thoroughly soaked. When laying the gutter the tin was turned over the edge of cap and nailed; the shingles held it above at the other edge by a few nails driven, strung along. Two years afterward we were doing some work on a house next door

to the one on which the gutter was laid when the owner came to us and told us his gutter had two holes in it and leaked, which he would like to have us fix. When we got on the roof we found that the seams were not broken, but that the tin had pulled in two between the seams. What was the cause?

Note.—This is certainly a rather singular occurrence, for which we are unable to assign a specific cause. It would require a considerable strain to tear apart any sound sheet of tin in a gutter, a good deal more, we are inclined to think, than gutters are likely to be subjected to. We would like an expression of opinion from our readers on this case.

Gauge of Iron for a Cistern.

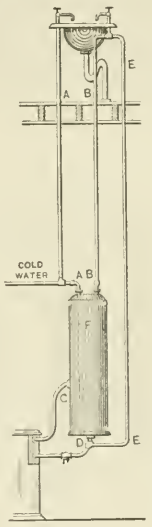
From W. and T., *Hamilton, Texas.*—Please inform us what number or gauge of galvanized iron would be the most suitable for making an overground cistern holding about 1000 gallons.

Answer.—This depends on what shape our correspondent intends to make the cistern or tank. If the body is to be cylindrical, with a flat bottom, a lighter gauge of iron will answer than if the tank is made square or with flat sides. For a round body about 5 feet in depth and 6 feet in diameter No. 18 (gauge) iron may be used. This gauge will be amply heavy if the tank is constructed according to the following directions: Make the body or cylindrical part of two courses, each 30 inches high. Rivet these together, spacing the rivets about 1½ inches apart. Make all laps about 1 inch wide. The bottom, after it is made the required size, can either be double seamed to the body, or if preferred it can be flanged up to fit outside the body and riveted to the same. Around the outside at the top of the cistern or tank place a ¼ x 2 inch iron band and also two bands ⅛ x 2 inches, one about one-third the hight of the body from the bottom and the other midway between the lower and the top band. Thoroughly soak all the seams when soldering the tank. If a somewhat heavier job is desired use No. 16 iron. If the cistern is to be made square with flat sides, or cube-shaped, much heavier iron must be used, the thickness depending on the number and character of the braces or bands put on it. Instead of using flat bands for bracing and strengthening the tank, use angle irons. The number and size of these angle irons will depend on the amount of pressure on the tank. A gallon of water weighs about 8 pounds, and the cistern in question when full would inclose a weight of 8000. From this calculation, and the fact that water presses with equal force in every direction from any given point, it is easy to see that a very severe strain would come on the sides of the tank near the bottom. The bottom should be securely riveted on and well soldered, and if No. 16, 12, or even No. 8 iron is used for the square tank, angle iron braces at frequent intervals should be placed on the sides. The angle iron for the braces should be 1½ or 2 inches or larger, according to their length.

Circulating Pipe on a Range Boiler.

From Young Mechanic.—Please inform me where to put a circulating pipe on a range boiler and how high to carry it up.

Note.—In order to cover all points of this inquiry a drawing is given of an ordinary circulating boiler, and its connections lettered so that the explanation may be made clear. A is the supply pipe, and connects with either of the openings in the top of the boiler, providing the tube shown by the dotted line connected with it extends down



Circulating Pipe on a Range Boiler.

below the point C and within 1 foot of the bottom of the boiler. There should be a ⅛-inch hole in the tube at F near the top to prevent syphonage. B is generally called the distributing pipe, though sometimes the circulating pipe. If the query refers to this pipe with the intention of avoiding the usual wait for hot water at a washstand in a third story or distant room until all the cold water in the pipe has run off, it should, after connecting with the faucet, instead of stopping there be run back to the boiler, as shown by E, and connect with the pipe D, which takes the cold water from the boiler to the water back. Then as the water cools at the distant stand it will drop down the pipe E and permit hot water to come up B and always be ready immediately when the faucet is opened. When a pipe like E is used it is called a circulating pipe, and must necessarily go to the highest point to which the hot water is carried, and this point is determined by the pressure or force on the supply pipe. The pipe C is far more generally known as the circulating pipe, and connects with the top opening in the water back and the opening in the side of the boiler. There is an advantage of some importance to be gained by having the pipe C one size larger than the pipe D, for when the water is expanded by the heat in the water back it finds its way to the boiler in a larger pipe much more readily. The bottom of the boiler should preferably be enough above the water back level to permit an easy turn and a slight decline in the pipe D. Circulation will go on if both of the water back pipes are of the same size and the boiler is so set that the pipe C enters only a few inches above the water back level, but that practice should be avoided. There should never be even a slight drop in the pipe C from the time it leaves the water back till it enters the boiler. The hight of the point at which C enters the boiler is fixed by the boiler makers, and is usually about one-third of the hight of the boiler from the bottom.

Accumulation in Chimney.

From C. J. G., *Plymouth, N. H.*—Will you please tell an old subscriber the best remedy for preventing creosote forming in a new chimney with which a wood furnace is connected in the cellar and a wood range in the kitchen? The chimney has been burned out twice a week on an average during the past winter. The fuel used is good quality, dry hard wood.

Answer.—To define the cause may suggest a remedy that it is possible to apply to the case. The solid matter is a part of the fuel which has not been burned and accumulates because the chimney is not large enough to carry off the smoke made by the fire, or it may be that the smoke is cooled too much before it reaches the chimney, and so deposits the soot. If these ideas are correct, they would suggest a larger smoke pipe as an easily applied remedy, or else the pipe might be covered and thus kept warm. Should these fail, another change would be a larger chimney, so that the smoke will not be retarded in passing out until it is cooled and the deposit made. Wood will burn well enough in a furnace to heat, or in a range to cook, with a draft of chimney less than is necessary to keep the chimney free. It may be possible that the chimney is low and subjected to depressing currents of air at its top.

Prof. George Forbes of the Niagara Falls Tunnel & Power Company says that the machinery which is to supply Buffalo with power from that source will be turning by the latter part of the summer or the early fall, so that many World's Fair tourists will have the opportunity of seeing it in operation. The initial tunnel will divert about 100,000 horse-power. This will certainly be increased to 450,000 horse-power, but it is improbable that the whole of this amount will be utilized for some time to come.

Nearly $2,000,000 worth of new buildings are under way and projected in Winnipeg, Manitoba, this year.

TIN PLATES.

The American Tin-Plate Situation.

We have received the following remarks on the situation of the American tin-plate industry from an observer in this city, who has had considerable opportunity of gaining an inside knowledge of the facts. Writing under recent date, he says :

Among the showers of verbal brickbats that have been hurled at one time or another at the American tin-plate industry the accusation that inferior or poor material was being put out from domestic works has never been included. The facts of the matter were too patent for even the most captious of critics to ignore. The assertion made in some quarters that no genuine American tin plates were being produced was long and persistently reiterated, and this ground was clung to even after proof upon proof to the contrary had been piled up high enought for the most purblind to see. When, however, the fallacy of the statement had become too glaring the extraordinary position was taken up by the same class of unbelievers that the tin plates now made in American factories are too good in quality, that the manufacturers must be losing money over them, and will, therefore, be obliged by degrees to lower the present standard, when the temporary reputation acquired for them will burst like a pricked bubble. This question was dealt with editorially, at some length, in *The Metal Worker* of April 22, under the caption, "Can Tin Plate Be Too Good?" I can only remark in this connection that, to my mind, in this very same excellence lies the whole secret of the success which, all objections to the contrary notwithstanding, has unquestionably attended the efforts of our domestic manufacturers to build up the new industry and to establish a reputation and a market for American tin plates. Putting aside for the present the question of loss to the makers, and the inference drawn from it, all of which is mere conjecture, and, I believe, based altogether on false premises, the broad fact stands out that out of the mouths of the opponents of the industry has come its best recommendation. The state of mind in which people must be who have to grumble because an article is too good must closely resemble that of the *blasé* character in the play, who sings:

Oh, don't the days seem lank and long
When all goes right and nothing goes wrong!
Oh, don't the days seem awfully flat
When there's nothing whatever to grumble at!

They must be very hard put to it to find fault. Had American tin-plate makers commenced by dabbling in the production of poor stuff, or devoted their energies at the atart to cheapening the cost of manufacture by the use of inferior materials and questionable methods, the American tin-plate industry would have been a failure. If not strangled at birth, it would have, at least, been now dragging on a precarious existence in face of a possible removal of the protective tariff which fostered it, and it would probably go down with all hands when such protection was removed. There would be no solid ground to fall back upon. Manufacturers would have no sound reasons to give in recommending their products to the notice of customers in competition with the imported article. But as it is, the best of the American producers are now able to put their plates on the market and leave them with confidence to the common-sense consideration of buyers, knowing that they will not suffer by comparison with any material offered by foreign competitors. The rivalry among domestic makers is now as to who can make the very best quality of plates and not who can make them cheapest. The consumer is ready and willing to pay a fair price for a good and reliable article; and our manufacturers and dealers have no difficulty in disposing of their American-made plates, even though their price may be, in some cases, a trifle ahead of that asked for Welsh material. The difficulty is, in fact, the other way. Dealers complain of not being able to get the supply they need to fill orders; and many of the best known makers, both in the East and West, are unable to keep abreast of the demand, although running their works night and day. This applies to the production of both bright and terne plates, but the pressure is more marked in the case of the latter, which have long ago taken a high and steady place in the estimation of the American roofer. This is fairly proved by the situation in American tin plate works at the present time. All establishments, so far as I know, are busy—many inconveniently so. Half a dozen concerns have additions to their works in hand or lately completed, increase of capacity being imperatively called for. Others are erecting rolling mills for making their own black sheets, or are adding to existing facilities in this respect, while three or four brand new concerns, promoted by substantial and experienced parties, are just about starting into the business. And this in the face of what it was believed would be a fatal blow to the whole industry, namely, the possible removal of protection. It goes to prove to the unbiased mind that the manufacture of American tin plates has a healthy vitality which it would be well-nigh impossible, at the stage which the industry has reached, to crush out. This healthy condition has been attained through the wise course taken by the pioneers at the start. Beginning at the top, and turning their attention and endeavors to the production of the very best material possible, they have placed American tin plates, as regards quality, in the front of the world's production. That "quantity" will eventually follow is as certain as anything can be in a land which possesses the "biggest" of everything, including world's fairs, land booms and financial collapses. It is merely a question of time—and not a long time, either—when the quantity of both tin and terne plates made in the United States will more than supply the home demand. Indeed, in the case of roofing plates, this is almost an accomplished fact; and I have the best of reasons for accepting as correct the forecast given me recently by a friend, a shrewd observer who is well up in the facts and statistics of the native and foreign tin-plate market, that within six months imported terne plates will be an unknown quantity, so rapidly is the native article displacing foreign roofing tin in the market.

SCRAP.

WE ARE FAVORED with a specimen of the handy little standing desk calendar which Gummey, Spering & Co. of Philadelphia are distributing to their friends, and which advertises the merits of their American roofing plates Pennsyl Old Method and Alderly. The calendar is of red leather, with a case containing transferable cards, each showing one month of the year from May, 1893, to April, 1894. The upper portion displays a neat ivoried tablet bearing the name of the firm and their registered trade-mark, the head of William Penn, besides the names of their brands of terne. Pennsyl Old Method is claimed to be the oldest old style plate in the market, and also the heaviest guaranteed roofing plate made, being, they say, treble coated.

A. A. THOMSON & Co., 213 Water street, New York, makers of the well-known Puritan brand of roofing plates, have decided that these plates shall in future be designated and stamped "Thomson's Puritan" to distinguish them from other plates of the same name in the market. The Puritan plates were first made abroad specially for A. A. Thomson & Co., in 1886, but are now being made by the firm at their own tin plate works in this country.

S. G. NEGUS, 40–42 College place, New York, the resident buyer in this market for the Harper & Reynolds Company, Los Angeles, Cal., having in the routine of business occasion to purchase roofing materials for that house, recently shipped them a carload of American terne roofing plates, which proving satisfactory he has sent forward another load.

N. & G. TAYLOR COMPANY, Philadelphia, Pa., and New York City, are continually diverting trade from foreign-made tin and terne roofing plates to analogous goods made by them. One of the comparatively recent acquisitions is that of a leading trunk line railroad in this country, who have settled down to regular orders in satisfactory quantities, specifying the same brand each time, which is taken to mean that they have found it suited to their needs and a proper article to reorder.

The first carload of tin from the Harney Peak Tin Company's mines in the Black Hills of South Dakota has been received by the Crooke Smelting Company of New York City.

STEAM AND HOT WATER.

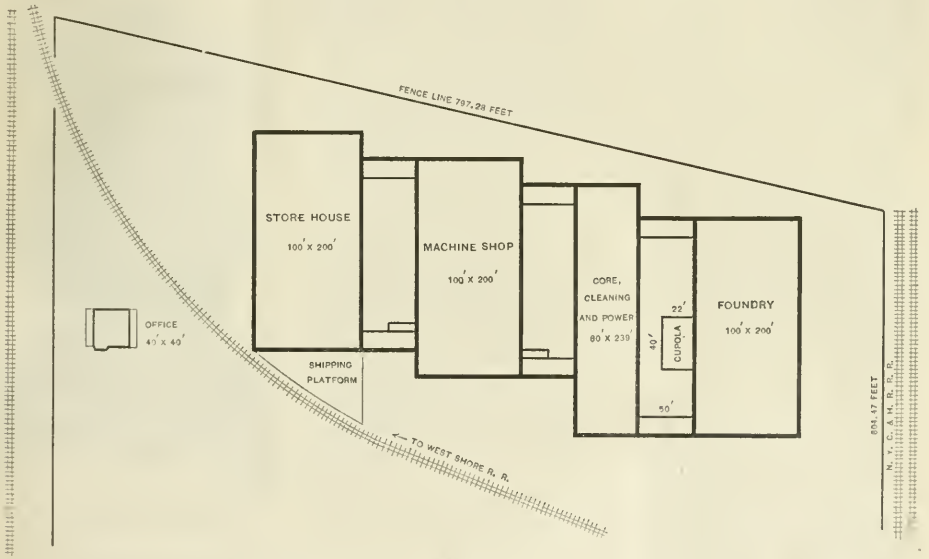
New Works for the Manufacture of the Florida Boilers.

In July last the Pierce, Butler & Pierce Mfg. Company decided to remove their works for the manufacture of the Florida heaters from Geneva to Syracuse, N. Y., and there to erect a plant with all the latest improved appliances for the manufacture of the Florida heaters. After looking over a number of places they decided to locate on the lands of the Central City Land Company in the eastern part of Syracuse, as this location possessed all the natural advantages for a works of this kind, having ample shipping facilities, being situated between the New York Central and Hudson River Railroad and the West Shore Railroad. Twelve acres of land were purchased, having a frontage of 697 feet on the N. Y. C. & H. R. R. R. and 688 feet on the West Shore Railroad. Plans were made for the buildings and on September 1 the contract was let for their erection. The first work done was the thorough underdrainage of the land. This was done by running a main drain through the center of the property with lateral branches for storm water and underdrainage. All trenches were excavated to the proper grade and tile of various sizes were laid to carry off the water. The joints of the tile are not cemented, and the trenches are filled up with broken stone for 2 feet above the tile, and at intervals of 50 feet the broken stone is filled in up to the grade line. Over 6000 feet of tile is laid to remove the storm water.

The land is very low at this place, and after a storm was always covered with water. After the drainage system was completed the soil became very dry and after a very heavy storm would dry out in a very short time. There is a continual discharge from the drainage system of over 60 gallons per minute, with a greatly increased discharge after a storm. A separate line of tile was laid to carry off all sewage. This tile is laid to a true and perfect grade. All joints are filled with oakum and Portland cement and are made water tight. The sewage is discharged into a filtering tank where all water is removed and then discharged into the main sewer.

All the buildings are brick on solid foundations and are built on the slow combustion principle. There are no solid side walls, all roofs and floors are supported on brick piers 2 feet wide, 8 feet center to center and the space between the piers is filled in with glass, which makes the buildings as light inside as it is possible to make them. The foundry building is 100 feet wide, with a row of posts in the center for supporting the roof and the electric traveling crane, 200 feet long and 22 feet high on the sides. There is a monitor on top, 20 feet wide and 10 feet high, with windows on each side. All windows are opened and closed from the floor by sash ventilating apparatus.

Attached to the foundry on the side in the center is a building, 22 x 40 feet, in which is located the cupola, fan and engine. Power is supplied to the fan and elevator by the engine, also to tumbling barrels and emery wheels in the cleaning room. The cupola has a capacity to melt 20 tons of iron per hour. One-half of the building next to the cupola has an electric traveling crane 50 feet wide running the entire length of the foundry. This crane has a capacity to lift 10 tons and carry it sideways and lengthways, all three motions at the same time. This is one of the most complete foundry buildings in this country. It is as light as day, and is arranged to have perfect ventilation. The foundry is connected at each end by a covered passage 14 feet wide to the core and cleaning building. The buildings are 50 feet apart, and the passages are made fire proof. In each passage are large wooden sinks supplied with hot and cold water for the use of the workmen. There is also connected to the passage water closets arranged with automatic flushing apparatus and all modern sanitary appliances. The core and cleaning building is 60 feet wide, 239 feet long and 20 feet high on the sides. It has the same monitor top as the foundry. This building is divided into three rooms by two brick fireproof walls. One end is used for cleaning the castings as they come from the foundry. The center room contains the ovens for baking the core used in making the sections of the Florida heaters. There are in this room four ovens, 7 feet 6 inches wide, 15 feet long; two ovens 15 feet wide and 15 feet long. At the rear of each oven is a furnace which furnishes heat to bake the cores. At the front end is a flue connected to a large main flue under the floor to carry off the products of combustion from the core ovens. This main flue is carried along underground in front of the core ovens to one end, where it connects to wrought iron pipe 24 inches in diameter and 50 feet high. In the other end are the boilers that supply steam to the engines and pumps. This



Plan of the New Works for the Manufacture of the Florida Boilers.

end of the building is divided into three rooms running lengthwise of the building. On one side is a blacksmith's shop for tool dressing, in the center room the boiler, on the other side is the engine room, where is placed the engine that furnishes the power for the electric crane and to the dynamos for lighting the buildings. In this room are placed the boiler feed, water supply and filter pumps and feed-water heater. There are two horizontal steel tubular boilers, each 16 feet long, 66 inches in diameter, fitted with the Backus smoke-consuming furnaces, Kilts' steam high and low water alarms, also automatic boiler feeders. The pumps are fitted with the Mason pump regulators to control the pressure on the boiler feed and water supply pump. Five 12-inch nickel plated gauges from the works of Schaffer & Budenburg show the vacuum, water and steam pressure. Power is furnished the electric crane and light for the building by two dynamos, one of 200 lights and one of 600 lights, furnished by the Fort Wayne Electric Company. There are two marble switchboards with switches to control all lights in each building, also ampère and volt meters, reostats, and a full and complete set of electrical instruments. The water supply for the building is taken from 16 driven wells, each 2 inches in diameter, connected into one 5-inch main pipe, which furnishes an abundant supply of pure water.

The machine shop is connected to the core and cleaning building the same as to the foundry, with a covered passage. This building is 100 feet wide, 200 feet long; first story 15 and second story 14 feet high. There are two rows of posts, 33 feet centers one way and 8 feet the other way, which support the second floor. On this line of posts is secured the shafting that furnishes the power to the tools. Power is furnished to this shop by an engine located at one end of the building. The second floor is used for a pattern shop, box making and light machine work. A 4000-pound elevator lifts all material to the second floor. The buildings are all heated by exhaust steam from the three engines. The exhaust from all the engines and pumps are connected into one main steam main, which equalizes the pressure on all the buildings. The main high-pressure steam main is also connected to the exhaust main. A Watson pressure regulator is used to supply what steam is necessary to keep the pressure on the main up to 1 pound. All condensation from the heating coils is carried into one main return pipe, which discharges into a receiving tank in the engine room, and from there pumped back into the boilers. Before the exhaust steam enters the main heating pipe it passes through a Hine eliminator, which removes all the cylinder oil from the steam. All heating coils are placed overhead and are made from 1¼-inch pipe. Over 28,000 feet of this size pipe is used in the coils. High-pressure steam mains are run from the boilers to the engine in foundry and machine shop.

The system of heating is so arranged that all the coils will fill with steam and produce a perfect circulation with one-half pound pressure on main supply pipe. A branch track is connected to the West Shore R. R., which runs in front of all the buildings, also the sand and coal building. Cars are unloaded or loaded direct from the buildings. Everything has been done to make this one of the most complete plants in the country. A narrow-gauge track runs through all the buildings and passages, with turn tables at all corners. On this track small cars are used to transfer all material used about the works. About 5000 feet of rails were used to build this track.

The store house is connected to the machine shop same as the other buildings, with a covered passage. This building is built after the same plan as the other buildings, 100 feet wide and 200 feet long, one story high. This building is used to store supplies and finished work as it is received from the machine shop. In front of this building is a shipping platform, where all material is received and finished goods shipped. The raw material is unloaded from the cars in front of the foundry. It is then taken into the foundry and the castings are made; from there into the cleaning building and next into the machine shop, where all machine work is done. They are then taken into the store house, packed and shipped.

Next to the store house and near the West Shore R R. is the office of the works. This is a two-story cottage design, 40 x 40 feet square. It contains office for the manager, bookkeepers and draftsmen, and is arranged with all modern appliances for doing the business of the works.

The works are now under the control of the American Boiler Company of Chicago, the Pierce, Butler & Pierce Mfg. Company having transferred the works to them. The plans for the buildings, sewerage, drainage, steam heating and steam power were prepared by E. P. Waggoner, engineer for the Pierce, Butler & Pierce Mfg. Company.

The following well-known firms furnished material for the buildings: Building contractor, W. J. Gillett, Syracuse, N. Y.; engine and boiler, Porter Mfg. Company, Syracuse, N. Y.; electric light, Fort Wayne Electric Company, Fort Wayne, Ind.; electric crane, Industrial Works, Bay City, Mich.; roofing, H. W. Johns Mfg. Company, New York; shafting and pulleys, Medart Patent Pulley Company, St. Louis, Mo.; elevators, Howser Elevator Company, Syracuse, N. Y.; belting, Curtis Mfg. Company, Syracuse, N. Y.; water filter, Bradley & Co., Syracuse, N. Y.; water tanks, Phœnix Foundry & Machine Company, Syracuse, N. Y.; sash ventilators, Hitchings & Co., New York.

Long Distance Steam Cooking.

One of the engineering successes of the World's Fair which is not visible to the public is the steam-pipe line from Machinery Hall to the Casino restaurant. When the scheme was first broached of doing all the cooking in the Casino by steam from Machinery Hall it was pronounced impracticable almost universally by engineers. Nevertheless the work was given in charge of second assistant mechanical engineer Arthur Venning and is now in successful operation.

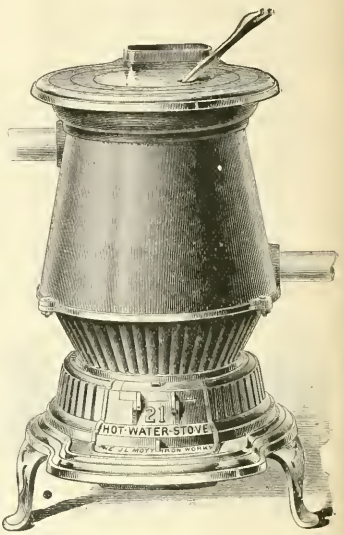
The pipe is six inches in diameter and runs from the boiler room at Machinery Hall across in front of the Colonnade, under the Agricultural Building, and ends at the kitchen of the Casino adjoining the Peristyle. It is 3000 feet long.

Steam was first turned on about two weeks ago, and since then the pipe has been in constant use. The pressure at the boiler room is 120 pounds and at the Casino end 100 pounds. When the pipe has been covered with magnesium to retain the heat the pressure will be much better at the Casino.

Great fears were entertained as to the successful operation of the pipe during the last week, as all the cooking at the Casino is done by the steam from it and a failure of the pipe line would have ruined the opening banquet, but Engineer Venning has had it patrolled night and day by two men watching for leaks, and so far it has proved a success in every particular.

Mott's New Hot-Water Stove.

The J. L Mott Iron Works, 84–90 Beekman street, New York, have added to their assortment of heating apparatus the one shown herewith, designed to heat water for range boilers and tanks suitable for small laundries, bathhouses, boarding houses, hotels, stables, &c., or where for any reason the range facilities are not equal to supplying a sufficient amount of hot water. The



Mott's New Hot-Water Stove.

stoves are made in two sizes, Nos. 20 and 21. No. 20 has a diameter of fire pot of 10 inches, depth of water cylinder 10¾ inches, and the manufacturers claim it will heat 40 to 50 gallons of water per hour. No. 21 has a fire pot 11 inches in diameter, with a water cylinder 14 inches deep, and a capacity of 50 to 65 gallons an hour. The cylinder is tapped for 1¼-inch iron pipe. The top of the heater is made with rings suitable to take in a 9, 10 or 12 inch clothes boiler, or may be put to various other uses, such as heating irons, &c.

T. C. Joy & Co., Titusville, Pa., issue a catalogue of radiators of their manufacture. The publication, of large size and oblong shape, contains 16 pages, and is bound in colored paper covers with embossed title in gilt letters. As usual with publications of this firm, the material is interesting and the presentation of the goods is effected in a novel way. The first two pages show full size cross sections of the Crescent and the Joy vertical flue radiators for steam or hot water. Another interesting page

presents sections one-half size of various radiator loops, printed in two colors, red lines indicating the unobstructed radiating surface, and black lines the obstructed radiating surface. Following are illustrations of the Crescent radiators for steam and hot water, a sectional view of the Crescent base and section for direct-indirect heating; then the Orient, the Joy vertical flue, the Crescent flue dining room, the New Crescent window and other radiators, including indirect radiators.

HEATING NOTES.

THE NEXT MEETING, or rather dinner, of the Caloric Club, will be at Chicago in the early part of June. The club members are manufacturers of steam and hot-water heating goods, and their monthly dinners afford an excellent opportunity for the discussion of interesting questions and establishing a mutual confidence that is always desirable.

ONE OF THE LARGEST BUILDINGS in the country to be heated by means of hot water will be the sanitarium to be erected in Milwaukee by the Sisters of St. Francis. Four of the No. 20 Bolton hot-water heaters will be required in connection with nearly 10,000 feet of radiation, the American Radiator Company's goods being used. The contract was taken by Cardes & Freis, 128 Clybourn street, Milwaukee, assisted by the United States Heater Company's agency, 100 Lake street, Chicago, John W. Mills, manager.

T. C. JOY & Co. of Titusville, Pa., have recently opened an office at 48 Centre street, New York, where samples of steam and hot-water radiators are displayed.

L. J. WING & Co , 126 Liberty street, New York, make a specialty of disk fans and ventilating apparatus, as well as electric motors to run them. They send drawings and instructions with their goods, which enable the average mechanic to set them up for use. Some of their recent shipments have been to the Paris Electric Light & Railroad Company, Paris, Texas; Bradley & Hubbard Mfg. Company, Meriden, Conn.; Stevens Mfg. Company, Fall River, Mass.; Reuter & Mallory, Baltimore, Md., besides a number in New York, among them the Murray Hill Turkish Baths, office of New York *Press* and the New York Electric Equipment Company.

W. M. MACKAY, manager of the school and public building heating and ventilating department of the American Boiler Company, at 92 Centre street, New York, will continue his custom of attending the conventions of the Steam and Hot Water Fitters' Association, and will be in Chicago to attend the meeting in June.

PRESIDENT JOHN SIMMONS of the John Simmons Company is doing Chicago on a pleasure trip, and in his absence the office at 110 Centre street, New York, is being rearranged to give greater facility in transacting a growing business in plumbers' and steam fitters' supplies.

THE WESTON ENGINE COMPANY, Painted Post, N. Y., issue an illustrated catalogue of the Bronson water-tube boilers of their manufacture. Sectional and general views of the magazine and base burner are presented and then illustrations of the boiler proper, separate; also the portable form of boiler. Later on is given a sectional view of the Bronson improved boiler for steam or hot water. In addition to the illustrations are tables of sizes and other interesting particulars, besides descriptive text. Special circulars issued by the company give information about the Bronson boilers, one circular in particular being printed in very pleasing style with red and black ink.

THE GURNEY HOT WATER HEATER COMPANY of Boston, Mass., will be represented in Chicago this year by Wallace Finch as manager of their Western office at 59 Wabash avenue, who will operate the territory of Illinois, Wisconsin, Nebraska, South Dakota and Minnesota.

C. F. BACHLER of 49 North Seventh street, Philadelphia, the general agent of the Monitor Steam Generator Mfg. Company of Landisville, Pa., expresses satisfaction at the outlook for sales of the Monitor hot-water boiler during this season. Toward the latter part of last season their limited capacity would not allow of their keeping up with their orders, but increased factory room and facilities will enable them to keep abreast with the demand this season. Mr. Bachler is at present supplying boilers for the Maennerchor Hall, Fifth street, and the large Harmonie Hall, at Eleventh and Spring Garden streets, Philadelphia. He is also supplying the boilers for the new Washington Hotel, at Seventh and Germantown avenue, Philadelphia.

THE AMERICAN RADIATOR COMPANY, 111 Lake street, Chicago, have sent out a handsomely engraved card to the hot-water and steam fitting trades, inviting them to make the above office their headquarters while in Chicago visiting the World's Columbian Exposition. Every facility will be furnished for correspondence, and the officers of the company will hold themselves in readiness to give general information. Another reminder to the trade is in the similitude of a mail bag, which, when opened, contains an invitation of the same purport. A third is still more unique, representing a shawl strap inclosing a roll of clothing, folded in the interior of which is another hearty invitation.

THE BUFFALO, N. Y., FORGE COMPANY have issued a catalogue of 286 pages descriptive of their hot-blast steam heating apparatus and the fans, blowers, steam engines, drills, forges, &c., made by them. Their hot-blast system of heating and ventilating is described by reference to buildings of diversified characters, drawings and perspective views being freely used to show the general arrangement in each case. These examples include public, private and office buildings, depots, theaters, hospitals, public schools, factories, &c.

GEO B COBB & Co., in addition to their New York house at 42 Duane street, have established a house at 35 North Seventh street, Philadelphia, and have some contracts for installing the steam heating plants in the houses that are built in rows in Philadelphia.

W. H. OAKES, manager of the American Boiler Company's Boston office, is generally known as a hustler and all-round business man of capacity, but he shines equally, though in somewhat different manner, after business hours. A *Metal Worker* man a short time ago made the surprising discovery that Mr. Oakes was a dramatic critic of deep penetration and rare good taste As a keen judge of comic opera he is unrivaled, and though his comments are not seen in print, they afford guidance and warning to his numerous friends. In opera his range extends from "Girofle-Girofla" to "The Spider and the Fly"; in drama from "Hamlet" to "The Span of Life," and if there was a Vaudeville Club in Boston there is little doubt that he would be a leading spirit in the organization.

THE BUFFALO FORGE COMPANY, Buffalo, N. Y., have been awarded contracts for the heating and ventilating plants for the new Christ M. E. Church, Pittsburgh, Pa., and the Calvary M. E. Church, Allegheny, Pa., two churches which are referred to as the largest edifices in either of these enterprising cities. The estimated cost of each of the buildings is $300,000. The heating apparatus consists in each instance of 12-foot fans, and heaters containing 6000 feet of 1 inch pipe. In every example of church heating and ventilation installed by this company, the apparatus is so built that it can be used as a cooling machine in summer, as well as a heating and ventilating plant combined during the cold weather. Arrangement is further provided that during the moderate weather hot air and cold air can be mixed, and thus the ventilation is kept up without overheating the audience room. The machinery and materials employed in the heating and ventilating plant for the above buildings constitute more than two carloads.

A CIRCULAR LETTER is addressed to the trade signed by George Bolton as inventor of the Bolton boiler and joint inventor of the G. & J. R. Bolton new improved boiler, in which reference is made to the report that he is liable to suit for infringement for using the G. & J. R. Bolton improved hot-water heater, and he further goes on to tell of his relations with the manufacturers of the Bolton heaters, and a contract that he entered into in 1887. Accompanying the circular is a business card giving his location at 85 Chene street, Detroit, Mich.

LAST WEEK, in referring to the fact that but one out of the 130 boilers made by John Davis of Second avenue and Eleventh street, Brooklyn, N. Y., for John A. Scollay, was defective, it should have been added that this number of boilers was simply the last order of April. Mr. Davis has made hundreds of boilers for Mr. Scollay, and we understand that but three out of the entire number have been returned.

Superintendent Hannan of the New York State Department of Public Works has issued an order that all persons desirous of experimenting with electricity and other power for propelling boats on the Erie Canal must have their applications for the privilege to so experiment on file by June 5. This order is issued in pursuance of a law passed by the last Legislature authorizing the superintendent to designate certain sections of the Erie Canal on which experiments may be made for testing the efficiency of such devices as may be offered for improving by electrical or other means the present system of canal towage, such experiments to be conducted at the expense of the parties making them.

The White Star Line has given an order to Harland & Wolff, the shipbuilders, for the construction of a steamer 800 feet long, which is being built on a new principle as to the engines and steering gear, and is expected to equal the speed of anything afloat.

PLUMBING and GAS FITTING.

New Plumbing Regulations in Mount Vernon, N. Y.

Under the authority of the act of the Legislature known as Chapter 602 of the Laws of 1892, by which the mayor of each city in the State is required to appoint an examining board of plumbers, measures have been taken in Mount Vernon, which received its city charter only last year, to perfect a system of sanitation which will be a guarantee of healthy home surroundings in that suburban city.

Some time ago the initial steps were taken by the appointment by the mayor of the Examining Board of Plumbers in accordance with the act referred to. The following constitute the *personnel* of the board: Alexander Clark of the firm of S. & A. Clark of Mount Vernon and Fourth avenue, New York City, chairman, appointed for three years; E. E. Martin of the Fiske Plumbing & Heating Company, secretary, appointed for two years, and Adam Clark, journeyman plumber, appointed for one year. These, acting in conjunction with Frederick S. Odell, Commissioner of Public Works, and Thomas Grassick, Inspector of Sewers (and now plumbing inspector), form the Examining Board of Plumbing, as called for by the law. The board has already discharged its functions as regards the examination of the plumbers and the issue of certificates, but as the number of the master plumbers is limited the work has not proved onerous in any degree. The duty of preparing a code of rules for sanitary plumbing, however, devolves also on the board, and they have formulated a very sensible set of regulations which have been approved by the Board of Health and are now in operation. Through the courtesy of E. E. Martien of the Fiske Plumbing Company we present herewith a *résumé* of these rules, which are sufficiently comprehensive, if properly enforced, to cover every point necessary to healthy living:

Briefly stated, it is required that all plans for plumbing work in new buildings shall be filed with the Board of Health for approval before the work can be commenced. All materials must be of good quality and the workmanship up to the best standard and separate connection of every house with street sewer by means of earthenware pipe, best quality of salt glaze. The house drain inside to be of cast iron and laid with a fall of ½ inch to the foot where it can possibly be secured. Modification of this permitted where the required fall cannot be secured. The usual trap at front wall is called for; the fresh-air inlet to be 4 inches, and not to open nearer than 15 feet from the nearest window. The trap which is to be used is what is known as the double hub trap: the hub on the sewer side to be fitted with cleaning screw, and the hub on the house side to be used as the connection for the fresh-air inlet.

Cesspools are permitted where streets are not sewered, the cesspools to be constructed subject to the approval of the Board of Health.

Where a well or cistern is on the line of sewer, 15 feet from the house, the sewer pipe must be of cast iron and tested in the same manner as the pipe inside the house.

Changes in direction of horizontal line of soil or drain pipe to be made with bends or Y branches. Cast-iron pipes to be extra heavy. Galvanized back-air pipes may be used where cast-iron would be unavailable. Vertical lines of vent pipe are not to be carried through the roof where they run up alongside of soil pipe lines. They are branched into soil-pipe above highest fixture and at bottom of pipe by means of Y branch. Porcelain water closets, with trap above floor, must be connected by means of floor plates and rubber gaskets.

Pan and plunger closets are entirely excluded. The only joints permissible in iron pipe work are lead or rust joints, the latter made with iron filings and sal ammoniac. House drains to be carried two lengths outside front wall trap before connection with earthen house sewer. The iron-pipe system to be tested by the water or smoke test. Connections of lead and iron pipe to be made with ferrules and lead joints to be all wiped. Vents of water closets and slop-sink traps to be 2 inches, and traps of other fixtures not to be less than 1½ inches, whether lead, galvanized iron or cast iron. Safe waste pipes to be carried to cellar and discharged on floor. If refrigerators are used, the waste pipes to discharge into a water-supplied sink in cellar. Where sewers exist in the street, neither privy vault nor cesspool will be permitted. Work to remain uncovered until inspected and passed by the inspector of plumbing. The entire charge of the plumbing and drainage, from the connection with the street sewer to the introduction of the soil pipe above the roof, to be in the hands of the plumber.

These constitute the provisions of the plumbing code which will be administered under the authority of the Board of Health, which is composed of the mayor, the supervisor and the health officer, the latter the executive officer of the board. The clerk to the City Council also acts as secretary to the Health Board.

It is the purpose of the authorities in carrying out the rules to recognize the plumber as directly liable for his own work, and where such work is reported in violation to the board, the notice of such violation is sent direct to the plumber.

Sheet Metal Pipe Straps.

The Smith & Egge Mfg. Company, Bridgeport, Conn., are putting these goods on the market, as illustrated here-

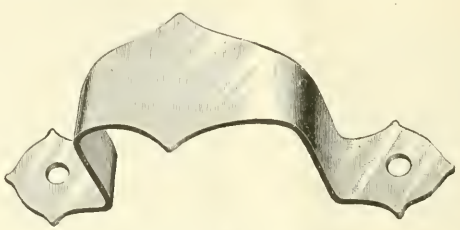


Fig. 1.—Sheet-Metal Pipe Strap.

with. The straps are made of sheet metal, nickel-plated on brass. They are referred to as being light, of ample strength, and as finished nicely for use on open work. The point is made that, being light, freight charges are much less than on cast straps. The strap shown in Fig. 1 is made in seven sizes, for pipe from ⅜ to 1½ inches. Those

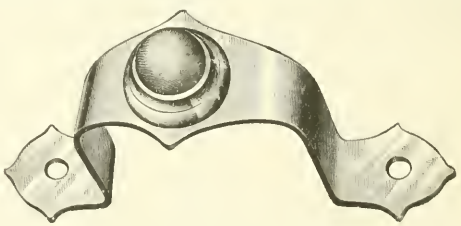

Fig. 2.—Pipe Strap with Rubber Bumper.

with bumpers are made in four sizes, for pipe from 1 to 1½ inches.

Chicago Master Plumbers.

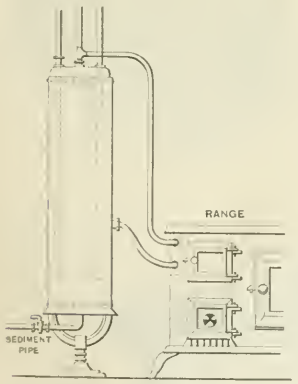
The regular meeting of the Chicago Master Plumbers' Association was held at their rooms, 197 Madison street, Monday evening, May 22. A large and enthusiastic number of members were in attendance, and a general discussion ensued regarding measures to be brought before the National Association. E. B. Kaiser, 161 Southport avenue, and William J. Bowman, 687 West Chicago avenue, were elected members. It was reported that arrangements had been made with the C. & N. W. Railroad for those attending the convention. All visiting delegates passing through Chicago were requested to call at the rooms of the association for further in-

formation regarding the matter; also to make the rooms their headquarters while in the city, and if desired, have their mail sent in care of Secretary Alex. W. Murray, 197 Madison street. In the prize competition for the best essay on "Sanitation," to be read before the National Association, two essays were presented, one under the *nom de plume* of "Old Quincy No. 9," (T. C. Boyd), and the other "Orphan Boy" (Alex. W. Murray). After the two essays had been read before the association it was decided by ballot that "Orphan Boy" was entitled to the prize. As the author desired that the amount of the prize be presented to some deserving orphan asylum, the association was requested to name one. It was decided by the association that the manner of the donation should be left entirely with the author, Alex. W. Murray.

Range Boiler Connections.

From C. S., *Bridgewater, Mass.*—Recent discussions in *The Metal Worker* on the subject of range-boiler connections remind me of some of my experiences in that line that may be of interest. Some years ago we put in a portable range to take the place of a brick-set range that was connected with a 50-gallon boiler. The boiler was set very low, and had been very noisy, and the owner wanted it made all right. As it could not be raised I used the bottom connection for a sediment cock only and connected the range at the side and middle or hot-water pipe at the top of the boiler, as shown in Fig. 1, and the result was satisfactory.

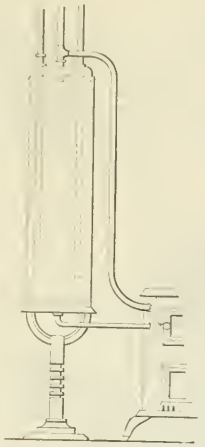
On another occasion I had a 40-gallon boiler connected in the usual way with an 8-inch portable range that would not heat water enough for a bath after



Range Boiler Connections.—Fig. 1.

having a hot fire all day. I tried to cure it by making a connection the same as in the first job, but was not successful. Arranged with a larger water front, it worked all right. I call to mind three other jobs that are connected the same way, one of which I will mention. The kitchen was only 6½ feet high, and as I wanted to use a high stand, and as the pipe had to cross the ceiling, I had a boiler specially made without the side connection and only 4 feet high. The hot-water connection on top of the boiler was 1 inch, and was connected to the range with a 1-inch pipe, as shown in Fig. 2. This heats water quickly; but if a bath or two are wanted before it all gets hot it seems to draw the colder water at the bottom of the boiler through the water front instead of taking the hottest water from the top of the boiler.

Note.—In the reproduction of both of our correspondent's sketches it will be seen that there are two pipes leading from the bottom of the boiler, from



Range Boiler Connections.—Fig. 2.

which we assume that there is a double cold-water supply. This point is not referred to in his letter.

Solder from Old Lead Joints.

From A. P. G., *Scranton, Pa.*—Is it possible to make a decent quality of solder by melting up old lead joints, pieces of pipe, &c., which are always plenty aronnd a plumber's shop? I have been informed that it is possible to do so, but it is difficult to judge of the quantity of tin to be added. Can you help me out with an opinion? Is it worth trying?

Answer.—The quality of home-made solder must be more or less coarse, considering the liability to throw into the mass what may not be suitable. The following has been furnished us as a good way to convert old lead scrap into "good"(?) solder, and we give it for what it is worth: In selecting the material to be melted be careful to throw out all galvanized joints. Melt up the lead and solder, and burn sulphur and rosin on the mass, stirring and skimming it clean. Then add tin until the white spots all disappear when poured out on a piece of iron. This will indicate that the stock is half tin. You can then readily ascertain by weight how much more lead it may be desired to add.

TRAPS AND VENTS.

CHARLES FERDINAND, Paterson, N. J., is an artistic wrought-iron worker, either from designs of his own or those furnished. His line of candelabra, piano lamp stands, hall gas fixtures, chandeliers and candlesticks would please the customer of any gas fitter. Another line is antique fire irons, both massive and delicate, elaborate and plain. Some of the screens or grill panels he exhibits are very handsome. A specialty is made of duplicating ornamental wrought iron of every description.

CHARLES BRABENDER & SON, Paterson, N. J., are coppersmiths whose work finds customers as far away as San Francisco. One of their recent contracts was in connection with the plumbing in a large brewery and amounted to over $1200. Coils and kettles for sugar houses and chemical works, and tanks and copper work of all kinds, as well as tinning copper come within their scope.

THE CENTRAL GAS & ELECTRIC FIXTURE COMPANY, 224 to 232 Canal street, New York, make a specialty of gas, electric and combination fixtures. In Brooklyn they have a large factory where all of their goods are made. At one time they imported many handsome gas fixtures, but claim that at present the necessity is overcome by the grace and delicacy of their own productions and that they now export goods. A recent shipment went to Mexico.

IT IS NOT EXPECTED that the Plumber's Registration bill, now before the British House of Commons, will get through Parliament this session. It has been crowded out by the all-absorbing Home Rule bill business. This will mean a delay of many months before it can become law.

THE TOWN COUNCIL of Leipzig, Germany, offer prizes of 5000, 3000 and 2000 marks for the three best projects for so purifying the sewage of the town that it may be allowed to pass into the river. The competition is open to all, and will not be closed until October 1. Conditions may be obtained from the Rath, Leipzig. A mark is nearly 24 cents of United States money.

JAMES MUIR & SONS, New York, have in hand considerable important plumbing work, not the least important of which is the erection of the plumbing in the residence of Cornelius Vanderbilt. Another feature of their business is that they do no contract work, all of their work being done on the day's labor plan.

AMONG THE NEW YORK PLUMBERS at the convention in Milwaukee will be H. G. Gabay, Frank Reynolds and E. J. Brady.

THE JAMES HAY COMPANY, Allegheny, Pa., have been granted a charter of incorporation, with a capital stock of $50,000. The incorporators are James Hay, James Walker, Ed. G. Hartje, all of Allegheny, and Charles Adams of Sewickley, Pa. This new concern will succeed to the business of James Hay, plumber and gas fitter, located on Ohio street, Allegheny, Pa.

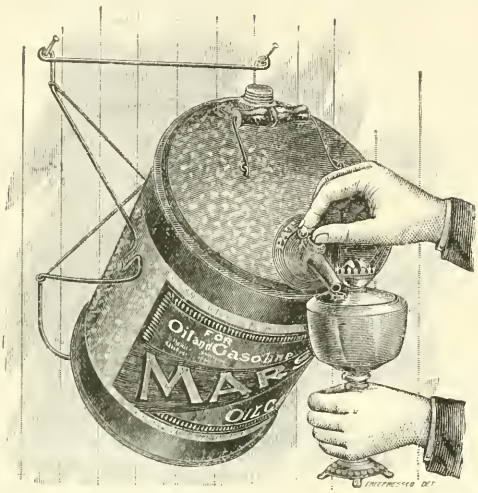
Work on the Public Buildings in Philadelphia has been suspended for some little time owing to the effort which has been made to abolish the Building Commission, under whose charge the work of erection has hitherto been carried on, and to place it under the direction of the Director of Public Works. A decision in the matter is expected shortly, when operations will be resumed. The completion of the structure will, however, take some time longer. All the massive columns and pilasters of the tower, together with some of the smaller iron work for the clock story of the Public Buildings, have been successfully passed through the electo-aluminum plating process at the Tacony Iron & Metal Company's works.

It is intimated from Washington that the Postmaster-General may take measures to hasten the delivery of the European mails by making further improvement in the ocean post offices.

THE RETAIL STORE.

The Mars Swinging Oil and Gasoline Can.

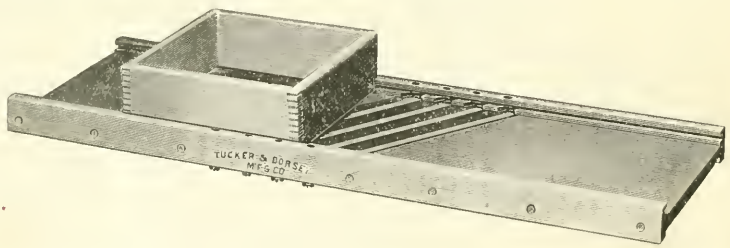
A galvanized steel swinging oil and gasoline can, which is being brought to the attention of the trade by the Detroit Galvanizing & Sheet Metal Works of 171 and 177 Csss street, Detroit, Mich., is illustrated in the accompsnying cut. This can is known under the name of Mars and is referred to by the makers as being exceptionally convenient for fsmily use. The statement is made that evaporation of its contents is impossible, as the valve which is used closes of itself when not held open. There are no pump or taps to get out of order and leak, and the arrangement is such that the can may be hung upon the wall, the side of the house, or in any convenient place. This, it will be seen, does away with the necessity of a shelf, while permitting its use in a position convenient for filling lamps, &c. The view which we present herewith shows the can suspended from nails driven in a wall or partition, and the manner in which a lamp can be readily filled. One of the features of construction is Briscoe's cast-brass valve spout, for which many claims are made. When it is desired to refill the can, it can be lifted out of the frame or standard by which it is supported and carried by the handle in the top. The manufacturers state that this can is well adapted for gasoline, owing to the fact that the gasoline stove may be filled directly from the can, the danger of evaporation being reduced to a minimum, by reason of the fact that there is nothing which can be left open. Only one size of the can is at present made by the company—that having a capacity for 5 gallons. In filling a lamp from the can the latter is tipped forward until the spout is inserted in the opening of the lamp. The lever is then pushed back, holding it with the thumb, or if it is pushed back to the center it will stay itself. When the lamp is filled the lever is allowed to slide into its proper place. Upon releasing the can it assumes its proper position. The manufacturers state that they are meeting with a very gratifying demand for the Mars can, more especially since they adopted the wire standard, by which it can be hung upon the wall.



Position of the Mars Swinging Oil and Gasoline Can when Filling a Lamp.

Adjustable Kraut Cutter.

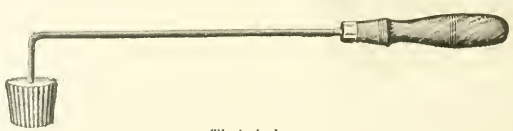
Tucker & Dorsey Mfg. Company, Indianapolis, Ind., are introducing this article, as herewith illustrated. The device consists of rocker-shaped bearings under the ends of the knives, which are held in position by bolts secured underneath by wing nuts. To adjust the knives the bolts are loosened, the knives set at the desired angle and the bolts tightened again. By taking out the bolts the knives are released and may be removed for cleaning or sharpening. It is remarked that any number of different adjustments may be made without fear of wearing down the bearings and thereby throwing the knives out of line. Among other features in the cutter the manufacturers call attention to the following: The frame work, side strips and sliding box are heavy, and are made from thoroughly seasoned hard wood, and the grain of the wood forming the body of the cutter is run crossways as an additional safeguard against warping, and the knives are strongly made of highly tempered steel, finely ground. It is claimed that the knives will last a lifetime, and that they will not bend and give down when in use, but will preserve an even cut.



Adjustable Kraut Cutter.

Timbale Iron.

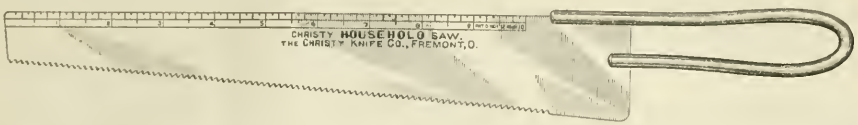
The accompanying cut represents a timbale iron, introduced by the Union Mfg. & Plating Company, Freeport, Ill. The head and blade of the article is a finely-plated casting, either plain round or fluted round, with a hand-polished black walnut handle. In use the head is dipped into hot lard and then into batter, thus giving crullers the form of the head.



Timbale Iron.

Christy Meat and Household Saw.

The Christy Knife Company, Fremont, Ohio, are introducing this article, as herewith shown. The blade is 12 inches long, with a scale measurement etched upon its upper edge. The wire handle is 4 inches long, securely fastened to the blade. The saw is heavily nickel plated and, it is stated, of excellent quality. It is designed for use about the house, for cutting the bone of ham or other meats, also for light work for which a saw is often needed.



Christy Meat and Household Saw.

Bee Smokers.

The accompanying cuts represent bee smokers, being offered to the trade by A. I. Root, Medina, Ohio. The improved Clark smoker, shown in Fig. 1,

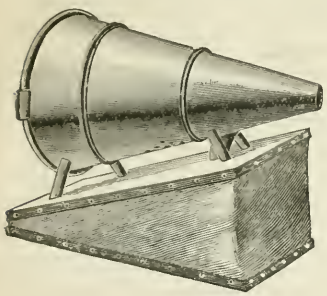


Fig. 1.—Cold-Blast Smoker.

is adapted to the use of planer shavings, excelsior mixed with saw dust, and soft rotten wood. The smoker is provided with a door at the large end for filling, and sandpaper beside the fire pot for lighting the match. The Crane smoker is shown in Fig. 2. The fire barrel is lined on the inside with asbestos

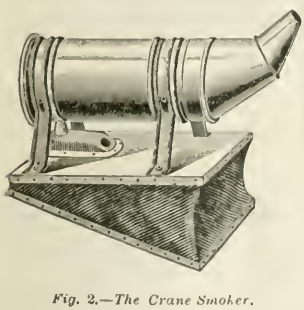

Fig. 2.—The Crane Smoker.

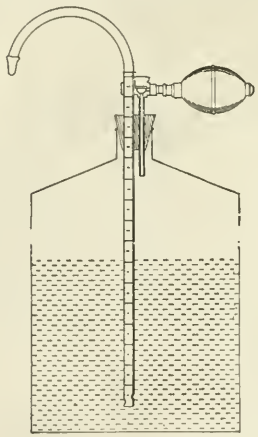
and sheet iron, as is also the cone, to prevent them from becoming uncomfortably hot, or filling up inside with creosote. They also avoid the use of shields, which, it is explained, are liable to get bent or caught. The principal feature of the smoker is referred to as being the valve and fire cup. The point is made that the bellows are large, with a durable elastic spring inside, and that the valve proper is held in position by another spring. The manufacturers state that the Crane hot-blast smoker has the strong blast of the Clark with all the advantages of the hot blast; that it makes no difference whether it is crammed tightly with fuel or not, as it will deliver the same force of hot blast as when empty, and that the smoke is not sucked into the bellows.

Universal Lamp Filler and Liquid Extractor.

Donathen Novelty Mfg. Company, 510 Broadway, Kansas City, Mo., are introducing the above article, as illustrated herewith. The cork is made of rubber, graduated, and slides up and down on the main tube, so as to fit any sized opening or depth, from a 1 quart to a 5-gallon can. It is recommended by the makers for filling gasoline stoves, lamps, &c., from a can without spilling a drop; also for forcing liquid out of bottles, jugs or demijohns. The design of the device is to provide at a small expense an arrangement that will make old cans as serviceable as expensive pumping cans. The article is made in two sizes—No. 2 for 2-gallon cans, and No. 5 for 5 gallon cans.



Universal Lamp Filler and Liquid Extractor.

KARST & BREHER, successors to Foos & Co., West Third and Exchange streets, St. Paul, Minn., have issued a pamphlet in which they state that in connection with their hardware, stove and house furnishing department they have just completed a new workshop, which is under the direct supervision of L. S. Breher, who gives personal attention to all work turned out. The firm handle Jewel and Quick Meal gasoline stoves, Carton furnaces, Hurd refrigerators, Philadelphia lawn mowers, Sterling ranges, Peninsular stoves and other goods of interest in this connection.

An Improved Hot-Air Damper.

We illustrate herewith an improved hot-air damper which is being placed on the market by the Excelsior Steel Furnace Company, Chicago. This concern have made and sold a great many dampers of the form and construction familiar to the trade, but seeing an opportunity of improving the same, they have built new machinery for the purpose, and are now turning out the new goods. In the new damper no rivets are used, the cleat holding the rod being formed of galvanized iron passing entirely through the damper and being clinched on the opposite side. The rod also has been improved by making the handle smaller.

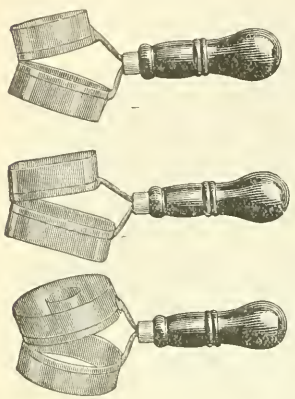
The new damper is made almost wholly on the die process, and, while a small thing, it may be interesting to note that in the course of manufacture it passes through fully a dozen different machines and processes. The disk or body is circled out on a machine built for the purpose, and then passes to a die which perforates eight holes through which the cleat passes. The cleat is cut out by a die in the form shown in the small figure to the right of the damper handle in the cut, and then is formed up by another press to the shape shown in the figure to the left in cut. Next the cleat is placed in position, and clinched by machinery and rod put in. The rod itself is first cut into suitable length from bars of steel, then passes through a machine which turns the handle, after which the rod is drilled and pointed. In spite of these numerous operations the damper complete is sold to the trade at a remarkably low price.

An Improved Hot-Air Damper.

A. E. HALLECK, 269 Court street, Brooklyn, has a sign in front of his store bearing the seasonable suggestion, "Now is the time to have your furnaces and fire-place heaters put in order."

Lebanon Cake Cutters.

Seltzer Specialty Company, Lebanon, Pa., are introducing cake cutters, as herewith shown. They are made in three styles and sizes: Nos. 1, 2 and 3. The No. 1 has one cutter 2¼ inches in diameter, and one 2¾ inches diameter. No. 2 has two oblong cutters, 2 x 2½ and 2½ x 3 inches in size. Both cutters of No. 3 are 3 inches in diameter, but one of them has a center cutter 1½ inches in diameter. The cutters are well and strongly made, with convenient sized black enameled handles. The cutters are attached at the proper angle to be easily manipulated and are designed to clean easily, being entirely open. They are intended for cutting biscuits, doughnuts and cakes.



Lebanon Cake Cutters.

Sales by Manufacturers and Jobbers to the Retailer's Customers.

This matter, which has been discussed at some length in our columns, is attracting wide attention and we are in receipt of many letters from the trade in which the subject is touched upon as seen from the different standpoints of the writers. Some, it will be observed, while protesting against the injustice and demoralizing influences of this practice, regard it somewhat in a spirit of resignation; apparently feeling convinced that nothing can be done or devised that will remove the evil. Others, however, advocate the vigorous adoption of retaliatory measures by the retail trade in the way of withholding patronage from the manufacturing and jobbing concerns by whom this method of securing a market for their goods is practiced, and in several cases it will be seen that our correspondents refer to the success which has attended their efforts in this direction. The formation of a national protective association, comprising retailers in all parts of the country, is also urged as a remedy.

We take pleasure in giving below extracts from a number of letters which have come to hand. These, it will be seen, without exception discuss the question from the retailer's standpoint. There is also obviously something to be said in regard to the interests of jobbers and manufacturers in the matter, and we shall be pleased to hear from them concerning it. The letters which follow are all from Hardwaremen in the State of Illinois, in which, perhaps, the practice in question is more generally encountered than in other States:

We would suggest where jobbers and manufacturers make a practice of selling to retailers' customers that the retailer quit dealing with the firm or firms that do so. That is the plan we would adopt. We are not troubled with any such practices here by jobbers or manufacturers, and the only way for retailers to break up such double dealing is to refuse to buy goods from parties that practice such underhanded business. In our judgment, if all the retail dealers would do as suggested it would very soon break up such practices.

We note with much interest the movement of retail Hardware dealers to protect their business. We find it impossible to secure the trade of the larger and responsible contractors and builders, as we cannot cut under prices obtained by them from the jobbers. In this section, however, the worst evil is the practice of the dry goods firms using Hardware as leaders. Not selling it at a profit, but often at less than wholesale cost to retail Hardware dealers, thereby drawing custom and probable trade for their regular line at prices sufficiently high to compensate them for selling Hardware at cost or less. This, of course, is taking our line of goods for purposes wholly illegitimate. And as the custom is rapidly on the increase the future of the retail Hardware trade is anything but encouraging in its prospects.

We make it a point, not to buy anything of those who cover the retail trade in our city.

We think if every one would adopt our plan, canvassing by jobbers' agents would be stopped.

It is beginning to hurt our trade to a considerable extent, and it has reached the point that the jobbers do not care whether the retail merchant buys of them or not. So you can see that it would not help us not to buy of them. I have, however, been buying of firms that will not sell to any one but the trade. I think that a protective association broad enough to cover the whole United States would be the only way to stop the evil complained of.

We have noticed a disposition on the part of small jobbers and large retailers of Chicago to reach out after trade, and in some cases have heard of manufacturers, especially in builders' Hardware, soliciting trade among the consumers, all of which is more or less annoying. Up to date, however, we have experienced no special loss of business. We can not complain of the treatment accorded us by the legitimate jobbers. We do not know of any of them who are selling direct to consumers, but have noticed an increasing tendency among manufacturers of builders' Hardware, and carpenters' Tools especially, to sell direct—the latter under pretense of introducing new goods. We have no reason to complain as yet, and hope we may not in the future, but are rather apprehensive of what may follow so much competition.

In this city and vicinity manufacturers and jobbers frequently sell their goods to carpenters. I would be greatly in favor of some method by which this practice could be abolished, as it injures the Hardware trade.

Jobbers agree to protect the retailer and then sell to any they can. I try to compete, but there is no use in trying, as I am too small a fish. —— sell direct to consumers at jobbers' prices. Not only these people but others do so who claim to do otherwise.

I have experienced considerable trouble and loss by jobbers and manufacturers selling to consumers and have made it a practice to have as little to do with those who resort to it as I possibly can. I always discourage the use of goods that can be bought from such concerns.

The retail Stove trade has been suffering and meeting with considerable loss of business by manufacturers selling to outside parties from catalogue in my section of country, which is forcing practical Stove dealers to curtail their stock and not carry the large stock of late years, and the Stove dealer is obliged to add other lines of goods to keep up, or shut up shop and go out of business. The combined Tin shop and Stove store are fast going and will soon be numbered with the past. Manufacturers are to a certain extent to blame for this. I have been 26 years in the Stove trade.

Our farmers and town people buy a good many goods from the manufacturers and wholesalers, from whom they obtain them very nearly as cheaply as we can buy them.

We have had some trouble from this source. A few of our commercial travelers are so anxious to increase sales that they are guilty of this practice

---

The John B. Varick Company, Manchester, N. H., whose store was destroyed by fire, have recently taken possession of their new building, built on the site of the old one. The building is five stories high, with a frontage of 37 feet and a depth of 100 feet; the entire premises occupied by the firm, including the warehouse, has a floor space of about 40,000 square feet. The building is fitted with modern improvements, and the stock includes Heavy and Shelf Hardware, Bicycles, Sporting Goods and House Furnishings. A Bicycle riding school and a machine shop, where Bicycle repairing is done, are features of the establishment.

STOVE TRADE NOTES.

Exhibits at the World's Fair.

Heating and Cooking Apparatus.

Manufacturers of cooking and heating appliances have not enjoyed special advantages in location. They are not in the central avenue in the Manufactures Building, as that has been dedicated to exhibits of foreign nations principally. A section in the east pavilion of the building toward the northern end was deemed by the authorities of the fair as the best space available for this purpose. It is crossed at several places by galleries containing other exhibits, cutting off the view. Under the circumstances the manufacturers of cooking and heating apparatus have done very well, and those who succeed in finding them will be well repaid for their trouble by the beauty of the exhibits. Beginning at the north end, the first in order is the display of.

COLLINS & BURGIE COMPANY

of Chicago, and

WILLIAM RESOR & CO.

of Cincinnati, who jointly occupy a space extending from aisle to aisle. It is inclosed by graceful pillars of white and gold, supporting a heavy cornice, gilt chains extending between the pillars. The floor is handsomely carpeted. The Collins & Burgie Company show the American Leader, Kalon Leader, and City Leader ranges; the Ardent Leader, Model Leader, and Columbian Leader cooks; the Carbon Leader soft coal base burner, the Oval Leader base heater, the Oak Leader, the Volcano cannon, and the Art Leader base burner. All are handsomely finished, but the Art Leader is especially resplendent in its dress of full nickel, with highly polished exposed surfaces and satin finished body. William Resor & Co. show the Monitor, Peerless Monitor, and Electric Monitor ranges; the Monitor, Peerless Monitor and Eclipse Monitor cooks, two Monitor oaks, three Monitor parlors, and two Monitor base burners. They are all very attractively finished. One of the Monitor Parlors and both the Monitor base burners are full nickeled and polished throughout. Passing down the east aisle, to the right, the exhibit next in place is that of

J. F. PEASE FURNACE COMPANY

of Syracuse, N. Y., who show the Economy steam and hot-water heaters and hot-air furnaces. The patterns exhibited are the Economy steam heater, low-down combination of steam and hot air, regular pattern combination steam and hot air, low-down warm air, regular pattern warm air, the Tropic warm air, combination hot water and warm air, and hot water alone. The different styles of grates and ash-pit sections are shown separately, also the steam boiler as used in the combination furnace. The hot water sections are also shown separately. The variety thus shown covers all kinds of heating apparatus in either separate or combined form. The floor is neatly carpeted and the walls and ceiling are covered with artistic wall paper, forming an attractive showroom. The front is inclosed by a heavy oak railing and balusters. Continuing toward the south, the next exhibit is that of the

AMERICAN RADIATOR COMPANY

of Chicago, whose pavilion extends from the east aisle to the next on the west. The roof of this pavilion is supported by heavy columns, with massive railings running between them. Heavy columns support ornamental arches in the center of the space. The painters and decorators are still at work on this company's exhibit, so that its beauties were not observable by our reporter, but with the very great variety of radiators they make and the well-known high finish of their goods it can well be imagined that the display will be a very fine one when in complete order. Next comes the

CHICAGO STOVE WORKS

of Chicago, with a remarkably pretty display. They have inclosed their space with plain but massive pillars in white and gold, supporting a roof which is ceiled with maroon-colored paper having a gilt border. Cloth hangings of the same color surround the room, while heavy lace and tassels form a very appropriate frieze. The stove platforms are covered with maroon cloth, and the floor is also covered with a rich carpet to correspond. The stoves shown comprise three Gold Coin ranges, two Gold Coin cooks, five Gold Coin base burners, a Gold Coin oak and a Gold Coin cottage. All are exceedingly handsome, the nickel work being especially meritorious. The heating stoves are completely nickeled, except one of the base burners, which is finished with some gilt work, making quite a novel combination. The full-nickeled Oak is worthy of special notice. The body is as highly polished as a mirror, while the fire pot shows up remarkably well with its beautiful polish. Electric lights illuminate this pavilion, a rich chandelier being pendent from the center of the ceiling. Occupying a choice space at the intersection of two avenues is the exhibit of the

MICHIGAN STOVE COMPANY

of Detroit, Chicago, Buffalo and New York. Their pavilion towers above everything in its vicinity. It is in the form of a huge cooking stove, representing the Family Garland, its big legs supported on low pedestals affording ample room to enter the space beneath, the under side of the stove forming a dome about 15 feet from the floor. This stove is a perfect reproduction of a cooking stove as to its exterior. The base skirting is of aluminum, while the company's trade-mark occupies a conspicuous position on the oven door. The words "Garland" on the front and rear, and "The Michigan Stove Company," on the side, will be illuminated at night by electricity from the interior of the stove. Electric lights will also illuminate the dome below, or ceiling of the pavilion. The space is inclosed by a heavy nickel railing made in their own works. The assortment of goods shown is large and extremely attractive, comprising three Monarch Garland steel ranges; the Challenge Garland, Champion Garland, Family Garland and Home Garland ranges, the first two being nickeled all over except the top, the Home Garland and Family Garland cooks, also resplendent in nickel and fine carving; six Art Garland base burners, full nickeled with recessed work gilded, producing a very ornate effect; five Peerless Garland cylindrical heating stoves with reversible flues; an Ideal Garland cottage stove, full nickeled and gilt, and a syphon-oak Garland richly finished in nickel, gilt and black. There are also a number of miniature ranges, complete reproductions of the large ranges, beautifully nickeled and gilded. Included in the exhibits are some rare old stoves, which will attract much attention. Standing beside a beautiful production in nickel, gold and tile, which is labeled, "The latest American base burner," is a quaint piece of stove work, bearing all the marks of ancient stove molding, sharp in its angles, severely square, and towering upward like a church steeple, on which is the placard "The first American base burner." Of the history of the latter we are not informed, but the contrast between the two is most marked. Another stove, fondly regarded as the oldest stove in America, occupies an honorable place in the center of the pavilion. It was imported from France at great expense. It is rectangular in form, made wholly of cast iron, and the side plates show some attempt by the molder at art work, in the representation of figures, vines and other ornaments. It is a wood stove and was made in 1656. A third is said to be the oldest cook stove in America. It was made in 1767 at Hereford Furnace by Thomas Maybury, as shown by the inscription cast on the side. It is also a wood stove, with a fire box and an oven of the class known later as tenplate stoves. One oven door is gone, but the rest of the stove is well preserved. It is not as artistic as its French prototype. These goods have a beautiful setting, with a rich velvet carpet covering the floor, making a superb showing in every respect. Turning the corner, the next exhibit is that of

ORR, PAINTER & CO.

of Reading, Pa. The arrangement here followed is very tasteful. The center of the space is occupied by a square platform, on which are grouped specimens of open fire places, or mantel stoves, in nickel and brass, the Happy Sunshine 4-hole range, the Radiant Sunshine open stove, the Home Sunshine 5-hole range, the True Sunshine 5-hole range and the Glad Sunshine 5-hole range. Rising in the center of these is a high platform, on which stands a Bright Sunshine base burner, with nickel and tile decorations. Running round three sides of the space are platforms on which stand the New Sunshine 6-hole range in two styles, the Kitchen Sunshine double-oven range,

the Domestic Sunshine single-oven French range, with horizontal boiler overhead; also, the same without the boiler; the Othello 6-hole range, the Grand Sunshine cook, the Perfect Sunshine 4-hole range, and the Merry Sunshine, Western Sunshine and Sunshine base-burners. An old-copper tubular railing runs across the front of the space and the floor is richly carpeted. Next comes the display of

THE MASON & DAVIS COMPANY

of Chicago, whose exhibit is inclosed within walls and a ceiling, giving the effect of a beautifully finished apartment. The ceiling is decorated, and a fine frieze ornaments the walls. A heavy oak railing incloses the front, the broad top making a convenient counter. The floor is neatly carpeted, and the ranges are placed round the walls. The exhibit comprises a large 9-hole double-oven wrought range, with charcoal broiler and high and low warming closets, a 6-hole single-oven range with reservoir, a 6-hole gas range with water heater and high broiler, an 8 hole combination coal and gas range, a 4-hole gas range, a 6-hole coal range, the same with high warming ovens, a 4-hole coal range and a laundry stove. The combination range is the most striking feature of this assortment of choice goods. The front and top are full nickeled and highly polished, the high warming closets and broiler are elegantly nickeled and a very pretty Russia iron canopy with an ornamental polished nickel molding and finial surmounts the whole. The gas ranges will be connected and operated during the exposition. Adjoining is the exhibit of the

RICHARDSON & BOYNTON COMPANY

of New York and Chicago They show a superb line of furnaces and ranges, the assortment consisting of the Fire King heater and the Perfect Room heater for large halls, the Perfect double return flue furnace, the Giant furnace, the Perfect wood furnace, the Perfect oval furnace, the Perfect 6-hole wrought range and the Perfect 8-hole double oven range Nos. 11 and 14 The furnaces are shown jacketed, but with portions of the jacket cut away, so that the interior construction may be seen. The grate and ash pit section is also shown separately. Crossing to the opposite side of the avenue the exhibit of the

MILWAUKEE GAS STOVE COMPANY

of Milwaukee, Wis., is reached. This is an excellent specimen of what can be accomplished in a very small space. They have only 6 x 7 feet on which they show a Perfection 6 hole and a Perfection 4 hole range, with water heater attachment, and a separate Perfection water heater, with a copper boiler near by. The ranges and boiler are well finished and beautifully decorated. They stand on a dark green carpet, with brass edging. Ornamental brass railings extend along the sides of the space, and large mirrors on two sides are framed in massive brass frames, while glass signs in black and gold extend across the top. In the next space adjoining is an exhibit of

THE POWERS DUPLEX REGULATOR COMPANY

of Chicago, who show a number of their temperature regulators in various styles of finish. An arrangement has been made by which the effects of varying temperatures are shown in the operation of the regulator. This is done by means of an ice chest with a rubber cover. The thermostat applied to this cover and then to another not connected with the ice chest operates dampers rigged in connection with a furnace near by. The principle of the regulator is thus essily demonstrated. Other applications are shown in a practical manner. The device has been adapted to steam and hot water, as well as hot air, the arrangement for hot water and low pressure steam being very prompt and effective in action. Another device shown is a natural gas regulator operated in connection with the thermostat, for regulating the flow of natural gas to the point of consumption. These regulators are now in use in the natural gas region and are in special favor among natural gas consumers in Chicago. Next in order is the exhibit of

J. W. WARNER

of Oneida, N. Y., who shows samples of his hot-water or steam boiler, styled Warner's Rapid Circulator. Two sizes of the boiler are in place, and in addition are shown some of the sections separately. This heater is built with vertical cast sections, each of which extends its whole hight. They can be coupled in any number desired, for either limited or large capacity. Each section has vertical passages on the sides, three horizontal passages at the top, over the fire pot, and one horizontal passage at the bottom. There are two fire pots—one in the usual place in front and the other in the rear, the latter being fed by a magazine, which opens on the side, near the top of the heater. Next comes the exhibit of the

CHICAGO CLOTHES DRYER COMPANY

of Chicago. They show a handsomely decorated apparatus, consisting of a stove of special construction for heating water and supplying heat for the dryer. In the rear of the stove is a completely metallic closet, with a number of sliding racks on which to hang clothes for drying after washing. The racks are made of galvanized iron, and slide in and out on trolleys running on bars arranged overhead. The stove used in connection with this dryer is a specially designed laundry stove with an oval fire pot and shaking and dumping grate. It is designed for boiling clothes, heating flat irons and furnishing hot water for domestic use, having a large water back. The exhibit of

GEORGE M. CLARK & CO.

of Chicago comes next. The Jewel gas and gasoline stove line will have a fine setting when finished, but the stoves had not been arranged for inspection at the time of the writer's visit. Next comes the exhibit of

H. M. CHAPMAN,

127 West Washington street, Chicago, who shows the heater known as Chapman's Combine, arranged for low-pressure steam heating, hot-water heating and high pressure steam for power.

(To be continued.)

THE STOVE TRADE will regret to learn that E. L. Messenger of Auburn, N. Y., is seeking to improve his health by a trip to East Junction, Col., where he may enter into the fruit-raising business. Having traveled many years for Sherman S. Jewett & Co. of Buffalo, N. Y., and more recently for the Abram Cox Stove Company of Philadelphia, he has many friends in the trade.

James Jones.

James Jones, superintendent and one of the directors of the Carton Furnace Company, Utica, N. Y., died a few days since at his residence in Utica after an illness of eight months. He was born in Manchester, England, March 1, 1824, and learned the trade of a molder. He came to America in March, 1848, and located at Waterville, where he worked for some time at his trade. Later he was employed in Albany, Troy, Cohoes and Leonardsville. He served with distinction in the Civil War, and at its close returned to Leonardsville, where he took charge of the molding shops of H. Dwight Babcock's Agricultural Implement and Furnace Works. About the year 1880 he went to Utica and took charge of the molding shops in the furnace works of E. A. & W. J. Carton. He was one of the incorporators and trustees of the Carton Furnace Company, which was formed in July, 1883. Mr. Jones was a man of the strictest integrity, straightforward, capable, and one who faithfully fulfilled the many duties devolving upon him. He leaves a widow and four children, one of whom has acted as superintendent of the Carton works since his father's illness.

Trade-Mark of the Art Stove Company.

The Art Stove Company, with office and works at Russell street, Milwaukee avenue and Boulevard, Detroit, Mich.,

Trade-Mark of the Art Stove Co.

have just been granted a patent on their trade-mark, an illustration of which is presented in the accompanying engraving. The trade-mark is not exactly new, but only recently has it been patented. The design is appropriate, considering the line of goods which the company are manufacturing, and if "laurels" have anything to do with success it is the impression that the Art Stove Company can use them without any hesitation. During the past two years the concern have increased their plant four times, and now state that their orders are such as to engage nearly the full capacity of the present plant.

The Brand Stove Company

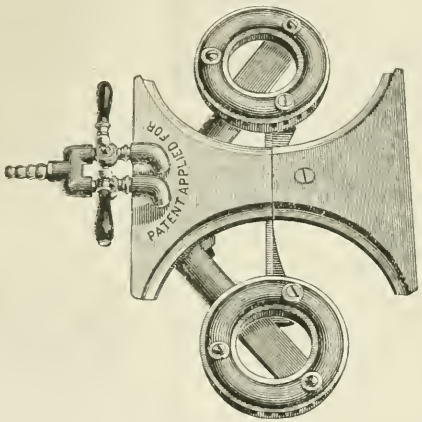
of Milwaukee, Wis., have issued two seasonable catalogues. One covers the company's Famous Wisconsin furnaces and the other their Famous gas ranges and stoves, and oil range and oil and lamp stoves. The furnace catalogue comprises 16 pages. It announces the expansion of their furnace department into a speciality. A short treatise is given on the subject of selecting and properly setting a furnace. This is followed by an explanation of the construction of the C series of furnaces, which have a cast V-shaped upper section or radiator, causing the heated smoke to travel in zigzag form before the outlet of the smoke pipe is reached. The furnaces in this series are made in

four sizes, for either brick-set or portable form. A line of steel radiator furnaces has been added this year in two series, known as F and R series. The steel radiator has a bowl shaped deflector. The furnaces of the F series have from 12 to 14 3-inch wrought iron cylindrical flues ranged perpendicularly along the inner side of the steel radiator. The radiator in the R series is of plain steel, adapted to meet the demand for a low-priced and quickly heating furnace. There are four sizes in each of these series. All have very large ash pits and revolving grate bars. The gas and oil stove catalogue consists of 24 pages. The Famous gas range is first taken up and its special features are treated in detail. Two sizes are made, the larger being adapted to a hot-water attachment. The water coils for the latter are so situated that the waste heat provides power for two cooking holes. Particular attention has been given to accuracy of fitting of all valves and connections, and the company give an absolute guarantee as to perfect operation. These ranges are artistically designed, lavishly ornamented with nickel work, and have finely polished edges. A line of junior gas stoves or hot plates is also made. The Famous oil range has been on the market for a number of years, and has won for itself a most excellent position in the trade. The burners are constructed on the principle of the student lamp, so that the tank is away from the flame, keeping the oil constantly cool. This range is mounted on a high cast-iron stand of ornamental construction, fitted with casters. The burners are drawn out by a sliding plate for cleaning or lighting. The drum is made of either cast or Russia iron. When made of cast iron it is provided with facilities for heating sad irons on the side while cooking on the top. Stoves of the same type are made with low stands, and with one to four burners. The Famous lamp stove is made with one to three burners.

THE CENTURY STOVE COMPANY of Dighton, Mass., who manufacture the Century ranges, are about to make an addition to their foundry, put in more machinery and rearrange the entire plant so as to afford the largest possible producing capacity. This concern is under the management of G. L. Walker, an experienced all-around stove man, and we are advised that the Century ranges are being very well received by the trade and that the demand for them is steadily increasing.

Coal Range Gas Attachment.

Geo. Bovier of New York has recently patented a gas burner attachment for coal ranges, which is being put on the market by the Harlem Gas Appliance Exchange, at 155 West 125th street, New York. The cut gives a clear idea of its use. The device consists of two gas burners attached to a short cross piece made for 6, 7, 8 and 9 inch stoves. The cross piece is made short on the points to fit any stove, and in two parts, cut in the center so that it may be lengthened or shortened as required and fastened at the desired distance by a stove bolt, which can be adjusted with a screw driver by any one. The burners are so attached as to be centrally located under the cooking holes and at the proper distance below them to give excellent combustion. It is claimed that the whole top of a stove is heated and the oven made available as a warming closet. Each burner has its gas cock, so that one or both may be used. To apply it for use only requires that the covers and cross piece be removed from the stove and the gas burner attachment set in place and a gas hose connection made with the nearest supply. It can be removed with equal facility when a coal fire is desired.



Coal Range Gas Attachment.

Heating by Electricity.

Much has been said and written about the future of electricity as a heating agent, one of the latest contributions to the subject being an article in an English gas journal. Although it is difficult to estimate the possibilities of the electric current, the difficulty, says the writer of the article, is rather one of setting bounds to the ingenuity of man within the limits set up for him by the nature of things than one of ascertaining what these limits are. This is especially true in regard to heating by means of the electric current. Ingenuity may be infinitely varied in regard to the use made of the heating properties of the current; but vary the application as you will, you cannot by any possibility get a given electric current to produce more than a given amount of heat, though you may concentrate the development of that heat upon so small a quantity of matter as to produce a very high temperature.

If we have a given quantity of heat and diffuse it through greater quantities of material, we obtain lower temperatures; but if the temperature be adequate, the important question comes to be, in reality, How many units of heat can I get at that temperature for a penny? In this particular application the question takes the form, How many units of heat can I get from a given supply of electric current? The answer is this, that there is a limit beyond which you cannot go; so much electric energy corresponds to so much heat, no more and no less. You may waste some of your current or some of your heat; but you can certainly never get any more heat out of a given current by any form of apparatus than the current energy itself will transform into. Then what is this maximum? Suppose we take 1000 watt-hours, the quantity of electric energy which is quoted at all sorts of prices from 3 half-pence to 15 pence, the Board of Trade 8 pennyworth (3 cents to 30 cents, say an average of 15 cents), and let us transform this into heat and see what we get. Of course we shall have to do some calculation, but the data are quite well known. Taking the energy unit known as an erg, the 1000 watt-hours are equal to the apparently large amount of 36,000,000,000,000 ergs; but if we translate this into foot-pounds we find that it is equal to 2,654,340 foot-pounds. Now, it requires 773 (?) foot-pounds of work in the form of heat to raise the temperature of 1 pound of water by 1° F. This was Joule's great discovery. Therefore the 8 pennyworth (15 cents) of electrical energy could raise 3434 pounds of water through 1° F.; and this quantity of energy could, in the form of heat, raise 2.95 pounds of steam at atmospheric pressure, and no more than that.

But the heat of combustion of about ¼ pound of coal could do the same thing; and assume, if you like, that you only recover 5 per cent. of it, and that the electric current costs only 5 pence (10 cents) per Board of Trade unit, then electricity at that price is equivalent in cost, for general heating purposes, to coal at 147 shillings 1 penny (over $35) per ton. One ought, however, to be able to recover a great deal more than 5 per cent. of the heat of combustion of coal, and if you do the equivalent figure goes up in proportion.

Electricity as a heating agent has, accordingly, its limits. It may be very convenient or even indispensable in particular cases; but for the general purposes of heating, the same qualities which are of advantage to it when it has to boast of its cool glow lamps and cool arc lamps stand in its way when it wants to enlarge upon its own remarkable heating powers.

ODD PLATES.

IT REMAINED for the Gobeille Pattern Company, Cleveland, Ohio, to find an appropriate use for the Columbian stamp. The reason for the colossal size of these publications has been as inscrutable as the existence of the mosquito, and probably the former. In the short time they have been before the public, have called forth more condemnation in verse and prose than has been launched against the mosquito since the discovery of New Jersey. The Gobeille

Pattern Company, however, have divined the intent of the designer of the issue and send out two-cent specimens carrying a quaint little advertisement printed over the mucilage, to the effect that any who are interested in originality in stove patterns will do well to use this stamp, and incidentally they refer to the Gobeille Pattern Company.

Spicer Stove Company, Providence, R. I., are showing to the trade their Model Grand range with latest improvements for 1893. The range is very substantially made, handsomely designed and ornamented in quiet, good taste. Some of the newer features are a patented portable shelf held in place by a lattice-work support, and a combination oven rack and rake, which, on being pulled out, carries with it any article that may be at the base of the oven and too far back to be reached easily by the arm. A feature of this range is the solid square-shanked oven door knob, which cannot be broken or twisted. Spicer Stove Company also show a line of French model double oven portable ranges, and manufacture toy ranges that are perfect *fac-similes* of the larger stoves, including flues and working parts. These little ranges may be operated the same as the larger one's and will produce somewhat the same results on a smaller scale. We are advised that they have met with a large sale, especially in the West.

The B. C. Bibb Stove Company of Baltimore will shortly issue to the trade a new catalogue of their furnaces. They are busily engaged at their works on orders and stock for the coming season and expect to increase their line by the addition of a new range and a heater.

The Kernan Furnace Company and Gurney Hot-Water Heater Company have established offices of the Chicago branch of their business at 59 Wabash avenue. These offices have been newly equipped and will be used jointly by the companies named for office purposes. Storage facilities of 8000 feet in the Walker-Oakley Building will be devoted to a display of a line of samples of each of these makers of heaters and for the storage of stock for Western shipment. Joseph Kernan and Wm. J. Owens will represent the interests of the Kernan Furnace Company in Chicago.

A new soft coal heating stove will be one of additional attractions to the Continental line of stoves made by the Buckwalter Stove Company at Royersford, Pa.

A gas cook stove, made by the London Fire-Appliance Company, on a novel principle, is illustrated in the London *Ironmonger*, and is said to be the first of its kind yet built. The method used is that of condensing tubes, in which, it is said, all deleterious fumes are converted into water and become perfectly harmless. No flue is used, but it is not shown exactly how the deleterious matter is eliminated from the vapor. The advantages claimed for this method of utilizing gas for cooking purposes are absolute freedom from smell, economy in consumption of gas, with better cooking results, and doing away with burners inside the oven.

S. B. Sexton & Son of Baltimore are finding that although they enlarged their factory buildings to a considerable extent last year the enlargement did not meet their requirements. They have recently been compelled to utilize their stables for foundry room, and to enlarge their warehouse by a one-story addition. They expect to put on the market this season a line of new furnaces of return flue construction, and will add several new patterns to their line of Baltimore heaters. They will remodel their Grand heater and their Baltimore range. The Grand Record range, which they introduced a season or two ago, will also be remodeled. The latter, they state, is meeting a splendid demand, and has proved to be a good seller.

The contest which has been extended over the past year in the case of the Front Rank Steel Furnace Company, St. Louis, Mo., vs. the Wrought Iron Range Company, St. Louis, Mo., has at last ended in a victory for the former, and the Wrought Iron Range Company's Home Comfort round steel furnace has been held by Judge Hallet of the United States Circuit Court to infringe the patent of the Front Rank furnace. A decree has been entered awarding the Front Rank Steel Furnace Company damages, profits and costs, and an injunction granted forbidding the Wrought Iron Range Company to manufacture, use or sell any more of these infringing furnaces. The legal fight between these two companies has been a long and bitter one, both realizing that the furnace in question was the best, so far as principle of construction goes. Evidence was taken in Chicago, Boston, Philadelphia and St. Louis, but the patent granted to the Front Rank Steel Furnace Company has stood the siege and come out unscathed. The Front Rank Steel Furnace Company very naturally feel elated over their victory, as their business last year showed an increase over the preceding year of over 60 per cent. and they see still greater gains during the present year.

H. W. Knight & Son, Seneca Falls, N. Y., are making a specialty of hair line Gothic letters and figures, which are turned out expressly for the use of stove manufacturers. The letters and figures are said to be very light, thus requiring little metal, while leaving nearly a smooth surface.

Adams & Gregory, 35 Arch street, Boston, Mass., have issued circulars of the Standard gas generator, a simple device for the use of kerosene oil as a fuel for heating and cooking purposes. The device is of such a character that it can be readily employed in connection with an ordinary cook stove or range, and the manufacturers claim that it gives entirely satisfactory results in operation.

The J. D. Smith Foundry Supply Company of Cincinnati, Ohio, have issued a series of circulars relating to their leading specialties. Prominent among these may be mentioned improved tumbling barrels, made in a substantial manner and furnished in octagon or square shape in almost any size desired. Attention is also called to Radiant facings and to a full line of Monk's celebrated molders' solid steel tools. These include a number of the latest shapes and sizes of handy tools suggested by practical molders. The company carry a large assortment and any tool in the list will, we understand, be mailed free on receipt of price.

The William Miller Range & Furnace Company of 9-11 West Fifth street, Cincinnati, Ohio, send us a copy of a family catalogue which they have just issued relating to the Miller Monitor wrought steel ranges. In the opening pages are given 12 reasons why these ranges are the best, following which are *fac-similes* of first premium gold, silver and bronze medals awarded at the Centennial Exposition in Philadelphia in 1876, the Centennial of the Ohio Valley and Central States at Cincinnati in 1888, and at other fairs and expositions where the company displayed their goods. The Miller Monitor range is illustrated in various sizes and styles, while descriptive letterpress gives an idea of the general construction, the principle features embodied, the sizes in which the stove is made, the area of the oven, top cooking surface, &c. There is also shown a line of wrought-steel laundry or tailor stoves, intended for burning coal, coke or wood. Another feature of the pamphlet is found at the close in explicit directions for setting up and operating the wrought steel Miller Monitor ranges.

The Great Western Stove Works, located at Leavenworth, Kan., are reported to have sold more stoves last year than in any other similar period since the works were established. The company are now running full in all departments, getting ready for the fall trade.

Armstrong & Co. of Baltimore, Md., have been delayed in getting out all the sizes of their new range, but expect to have them on the market very shortly.

The Quincy Steel Range Company, with a capital stock of $10,000, is the name of a concern recently incorporated at Quincy, Ill. The incorporators are Lemuel C. Ross, Edward J. Drake and William H. Goverst.

The Anshutz-Bradberry Company of Allegheny, Pa., send us a copy of a 48-page catalogue which they have issued in the interests of furnacemen and builders. Within the terra cotta colored paper covers attention is invited to a complete line of warm-air furnaces made under the name Tremont. The claim is made that these furnaces combine all essential points which go to make a superior heater, that they are constructed of cast iron and steel plate and are adapted to anthracite or bituminous coal, coke or natural gas. The Tremont furnace is carefully illustrated and described, while tables are presented giving dimensions and capacities of the various sizes in which the heaters are made. Some general remarks on cold-air supply, the piping of furnaces, principles embraced in the Tremont warm-air furnace, a table giving capacity of pipes and registers and numerous suggestions of general interest in this connection are other features of the pamphlet. Fully one-half of the publication is devoted to testimonials and recommendations of those who have used the goods named. At the close of the pamphlet attention is invited to the Perfect Tremont six-hole range, made in three sizes, garbage burners, grate fronts, bake oven doors and miscellaneous goods.

"The House Comfortable, or Handbook of Hints on Warming and Ventilation," is the suggestive title of a 48-page pamphlet which is being issued by the Weir Furnace Company of Des Moines, Iowa. Within its colored paper covers is presented a great deal of matter relating to the subjects named, which is of intesest and value to the furnaceman and builder. It is designed to be circulated among people who are interested as to the best means of warming and ventilating their homes

and those who desire information of a practical character that may be applied to making the house not only comfortable but healthful and clean. While issued primarily for advertising purposes, it touches upon phases of warming and ventilating which are of general interest. Numerous illustrations are introduced showing some of the buildings in connection with which the company's systems have been employed, together with cuts of the Weir portable and brick set furnaces. We have before us four copies of "The House Comfortable," one of which bears the imprint of the Weir Furnace Company, and each of the others the name of one of the company's branches. These are the Lincoln Range & Furnace Company, Lincoln, Neb.; F. Meyer & Brother Company, Peoria, Ill., and the Standard Mfg. Company, Kansas City, Mo.

The numerous friends of William Corry who for nearly two months past have missed his genial presence from the neighborhood of Beekman street, will perhaps be interested in knowing that he is summering on his farm at Douglaston, Little Neck Bay, L. I. Here he is busily engaged in the mysteries of fin keels and models of big yachts for the Douglaston Yacht Club, in which Mr. Corry is deeply interested.

H. Shapiro, 107 and 109 Walker street, New York, in addition to manufacturing a line of plain stamped and japanned tinware, has recently brought out a line of gas stoves and oil stoves.

"Public Opinion" is the name of an interesting publication which is being issued with the compliments of the Carton Furnace Company of Utica, N. Y., and Chicago, Ill. It is what may be designated as a reference catalogue, containing as it does a large number of testimonials relative to the Carton furnaces and heaters. The letters emanate from all sections of the country, covering a wide range of territory and a period embracing nearly half a century. Among the letters are to be found those from persons who have used the Carton heaters for the past 30 years, and who after such a severe test particularly emphasize the merits of the company's goods. In addition to the long list of testimonials there are presented illustrations of the company's heatets, together with descriptive letterpress.

James Boyle & Co., Salem, Ohio, favor us with a neat calendar for the month of June. It is of the same size and style as the calendars which the concern have issued for previous months of the year, and carries in addition to the days of the month and week a view of the Perfect Oak stove. On the back of the card we find descriptive particulars referring to the Perfect Oak as possessing a number of interesting features. All the doors are said to be fitted against lap joints and fastened with turn keys and latches. The draft slides are wedged so that when closed they are air tight. The grate is of the shaking and dumping cone type, which, the makers claim, prevents clinkers and requires less fuel than the flat grate. Other features include extra sectional linings, double cut off wood grate with the makers' special shaking arrangement, extra large ash pan and attractive decorative features.

The Ohio Stove Company of Tiffin, Ohio, contemplate removing their stove works to Fulton, Ill., as soon as they can complete the erection of their new works. The latter includes a main building three stories in hight and 40 x 200 feet in size; molding room 100 x 150 feet; scratching and tumbling room 30 x 100 feet; engine room 32 x 45 feet; carpenter shop and nickel plating building 20 x 40 feet and two stories in hight; fire proof pattern building 25 x 40 feet and three stories in hight, and sheds 20 x 200 feet. All the buildings with the exception of the sheds, which will be frame, are being constructed of brick with metal roofs. The buildings are located at the junction of the Chicago and Northwestern and the Chicago, Milwaukee and St. Paul railroads, with "Y" connection with the Chicago, Burlington and Quincy road. We understand that the cause of the removal on the part of the company is that the bulk of their trade is West, and it is their desire to locate their works as near the center of distribution as possible. Fulton is on the Mississippi River 136 miles west from Chicago and the company feel that by their removal they will not only enjoy increased manufacturing facilities but also better means of distributing the finished product.

Giles F. Filley of St. Louis, Mo., has recently been granted a patent for an improvement in cooking stove construction, by which the heat is conducted more evenly from the fire space over the oven and delivered more uniformly to the bottom flue beneath the oven. A patent has also been issued to Mr. Filley covering range construction where a reservoir is employed. The object sought is the same as that mentioned in connection with the first patent. A third patent is for an improvement relating to three-flue cook stoves and ranges having a low-down reservoir In such stoves it has heretofore been the practice to warm the reservoir with the heat from the diving flues of the stove. In the present construction the reservior is not heated at the expense of the oven, but with heat which has passed around the oven and into the ascending flue and which otherwise would escape to the chimney.

E. E. Barto, representing the Abram Cox Stove Company of Philadelphia, is looking after the interests of his customers in New York and vicinity. The New Splendid range attracts the interest at present, while the Starling parlor goods are investigated with interest preparatory to the fall trade.

B. W. Baeder, representing the Lehigh Stove & Mfg. Company of Lehighton, Pa., is visiting the stove trade in New York and Brooklyn previous to a trip through the State in the interest of the Lehigh stoves and ranges.

Southard, Robertson & Co. of Water street and Peck slip, New York City, are about introducing to the trade a new range intended for use in flats. It is known as the Waldorf, and is said to have the largest oven of any stove of its class now on the market. It embodies the modern features and is neat and attractive in appearance.

Harry King, formerly with the Abram Cox Stove Company, is now representing the Kernan Furnace Company of Utica, N. Y. He has been spending a few days in New York City, where he has made some sales.

Practical Experience vs. Theory is the title of a circular sent out by the Bedford Heating Company of Brooklyn. It states that an experimental year, under the management of Chas. B. Hotchkiss and R. W. Cunningham, has been satisfactory to the extent of requiring increased facilities for handling the business. They add to their line of Bay State and Beaver furnaces the Bedford Ideal furnaces, and have the Maywood sectional art tile mantels, hearths and facings. Ranges and kitchen furniture to meet the modern demands are a part of their stock. Heating, ventilating, range and tile work receive their special attention and the benefit of a long experience of the managers with the Barstow Stove Company.

The Quick Meal Stove Company, St. Louis, Mo., have placed on the market a new hot-plate gas stove, made in one, two and three burner styles. The entire stove is of cast iron, of artistic design and furnished with gas-needle valves. The goods are meeting with much favor at the hands of the trade.

The Detroit Stove Works are particularly pleasant employers. They entertained their travelers of both Chicago and Detroit, 25 in all, at Detroit, on May 4, 5 and 6. The first day was spent in inspecting the company's mammoth works, which are now so extensive that the company claim to have the largest stove plant in the world. In the evening the visitors were taken to the theater, and afterward given a banquet at the Detroit Club. The table was set for 30 plates, all the officers being present with the exception of President E. S. Barbour, who had been slightly indisposed and was consequently unable to attend. Speeches and merry making followed until the "wee small hours," and a very jolly time was enjoyed by all. The next day was spent in the offices and sample rooms, and the travelers returned to their respective stations the day following, being much benefited by their short outing.

The Indiana Stove Works of Evansville, Ind., have issued a postal card to their friends in the trade, calling attention to a slight fire on the afternoon of Friday, May 19, which damaged a portion of their stock. The following morning, however, the company were busy in all departments, and they state that they are now ready to promptly fill all orders as before.

The Western Stove Mfg. Company,

with office and salesroom at 506 North Main street, St. Louis, Mo., have issued a neat stove catalogue of 68 pages, bound in colored paper covers and carrying illustrations of many of their leading specialties. The lines shown are made under the name "Bake-Well" and embrace constructions embodying the modern features and decorated in a tasteful manner. The list includes the Model Bake-Well for soft coal or wood; the Granger, Tariff, Midland, Bonnie Bake-Well, a range for wood only; Waco, Cherry and Eureka. The leading place among the heaters is given to the Value, a very neat parlor stove, which has been added this season to the company's assortment. It is made in two sizes direct draft, and in the same number as a base burner. An interesting variety of oaks, round base burners, Franklins and cottage parlor stoves are presented, while special attention is invited to the Rattler, a heavy egg cannon stove, made in two sizes. The Uncle Tom and Mascot are cheap laundry stoves, while the Artistic, Daisy and Silver Moon are tastefully decorated Todd stoves. A miscellaneous line of stove hollow ware and trimmings completes the work.

TRADE REPORT.

The Iron Market.

The situation as reflected by the Pittsburgh market presents a few encouraging features this week, and it is the impression that between now and July 1 there will be considerable activity among the mills, with a probability of higher values for some lines of goods. The advances in Bessemer Pig and Steel of last week have been sustained and the tendency of the market is in the direction of still higher prices for both materials. Makers of Structural Material are being favored with increased business, the very low prices ruling having stimulated buying to considerable extent.

In Wire Rods, Wire and Wire Nails, there is only a fair business with prices stationary. Pipe and Tube makers are having a busy season and a strong effort is being made to adhere closely to established discounts. Bars are in better demand, and buyers are hurrying in orders for shipment before July 1 in anticipation of trouble over the wage scales.

In the vicinity of Chicago the Iron trade has been remarkably quiet, and extreme stringency prevails in the money market; banks are curtailing discounts and accumulating heavy reserves to meet heavy possible demands from depositors.

Pig Iron.—Southern lines announce that the rail and water rates to Baltimore, Boston, New York, Philadelphia and Providence are not affected by the advance in arbitraries on Pig Iron north of Hagerstown, Md., and Alexandria, Va. The advanced rates, which will be issued at an early date, will, of course, affect chiefly interior points in Central and Eastern Pennsylvania, and even indirectly will not materially influence the markets tributary to New York, except possibly to increase the pressure by a part of the amount of Pig Iron crowded out of the district affected. We quote Northern brands at $14.50 @ $15.25 for No. 1; $13.75 @ $14.50 for No. 2, tidewater. Southern Iron, same delivery, $14 @ $14 50 for No. 1; $12.75 @ $13.50 for No. 2, and $13 @ $13.50 for No. 1 Soft.

The condition of the Philadelphia market is somewhat complicated, owing to the announcement of a new schedule of freights from the South. All that can be fairly claimed at present is that the market is unsettled, and that sellers ask more money. Buyers are not much disturbed in regard to the matter, they would be glad to see an upward movement; but in the meanwhile they are not buying anything that is not actually needed.

General quotations for Philadelphia and equivalent points are about as follows:

American Scotch, No. 1X...	$16.00	@	$16.50
American Scotch, No. 2X...	15.00	@	15.50

Chicago merchants report that their principal occupation at present is making collections. New business is slow, and every effort is being made to obtain money due on past transactions. Northern and Southern Coke Iron are equally neglected. Prices are unchanged, as sellers believe it is useless to offer inducements while existing conditions prevail. Lake Superior Charcoal is also quiet, but sellers report the market hardly as firm as it has been. Quotations are as follows, cash, f.o.b. Chicago:

Lake Superior Charcoal.....	$16.50	@	$17.00
Local Coke Foundry, No. 1	13.75	@	14.25
Local Coke Foundry, No. 2.....	13.00	@	13.25
Local Coke Foundry, No. 3.....	12.75	@	13.00

The stringent money market has caused a curtailment of operations among many Southern customers of Pig Iron, especially car works, and the purchases have been light, individually and in the aggregate, during the week. Buyers who have previously purchased liberally for forward delivery are not now anticipating their wants more than a month or so, and there is, therefore, no large buying, but there are numerous small purchases, which keep the market from absolute stagnation. The demand is mainly for No. 2 Foundry Coke Iron and Gray Forge. More would sell, but it is scarce and the sales of No. 3 Foundry are in considerable demand. The stronger Southern Iron companies are not urging their Iron on the market, but there are liberal offerings by other furnaces, so that purchasers can buy Gray Forge at $7.75 ℔ ton, f.o.b., Birmingham, and No. 2 Foundry at $8.75. Of course these prices are not for single car lots. The tone of the market is anything but strong, but we hear of no lower prices even suggested, much less made. Quotations are as follows:

Foundry.

Southern Coke, No. 1.	$13.00	@	$13.25
Southern Coke, No. 2.....	11.50	@	11.75
Southern Coke, No. 3.....	11.00	@	11.25
Ohio Soft Stone Coal, No. 1....	16.00	@	16.25
Ohio Soft Stone Coal, No. 2 ...	15.00	@	15.25
Mahoning and Shenango Valley	14.75	@	15.00
Hanging Rock Charcoal, No. 1..	19.00	@	19.25
Hanging Rock Charcoal, No. 2..	18.00	@	18.50
Tennessee and Alabama Charcoal, No. 1	15.50	@	15.75
Tennessee and Alabama Charcoal, No. 2....	14.50	@	14.75

The State of Kansas has just opened an employment bureau, "and will seek to supply employers with help at five cents for each situation, or, rather, for placing employer and employee in communication with each other."

Metal Market.

Pig Tin.—Heavy importations, further additions to the surplus stock here, practical elimination of "short" interest in the speculative arena and extreme caution on the part of investors, along with some minor influences, have brought about a further sharp decline in prices. A week ago market prices were about 19.85¢ for May, 19.95¢ for June and 20.10¢ for July delivery, Those prices looked low at that time, particularly when compared with the figures prevalent at the time that the McKinley "boom" was at its hight, but the events of the past week have put a different complexion upon affairs, chiefly through showing that rock bottom was not reached when the price went to 19½¢ or about 2¢ ℔ lb below recorded market value one year ago. Between the statistical position, present low prices and the uncertainties as to the future of the McKinley duty, the market is an extremely hazardous one for speculative ventures.

Copper.—Business has been moderate, demand has dropped off somewhat as well, and the offering has reflected no change in the attitude of sellers. Prices have not suffered to any marked extent, but the market has a rather soft appearance at this writing. There are sellers of Lake Superior Ingot at 11¢, Electrolytic at 10¾¢ @ 10¾¢ and Common Casting Copper at 10¢ @ 10¼¢, for delivery three to six months ahead. Spot stock, in wholesale quantities could have been secured at about the same prices.

Pig Lead.—Early in the week a few parcels of common domestic were picked up at 3.80¢ @ 3.82½¢. Subsequently about 300 tons were placed at 3 85¢. The entire business makes an indifferent showing, however, and the apparent turn for the better in tone of the market would appear to be due more to lighter offering than to scope of buying or demand.

Spelter.—The offering of Western brands at 4¼¢ for delivery during the next six months has been freer and rumor had it that some business was put through at a shade below that price. The demand at present is extremely tame, leaving the market in quite as unenviable shape as it was a week ago and suffering under the weight of excessive production.

Antimony.—About the usual business in small parcels has been effected. Otherwise the market remains very quiet, with little change in prices. Cur-

rent quotations are 9 90¢ @ 10¢ for Hallett's, 10¼¢ @ 10½¢ for L.X., and 10½¢ for Cookson's, in wholesale lots.

Tin Plates.—Business has not improved. Spot goods have moved out in rather small quantities only and futures, drawing the line at some few specialties that are mostly bought direct by large consumers, have received little attention. Prices have been quite well maintained, however, remarkably so considering the full supply and sluggish condition of the market. The market from the consumers' standpoint remains unchanged, prices and demand being about the same as last week.

Coal.

The Anthracite Coal trade is quickened into temporary activity by the question of an advance in prices June 1, many consumers providing for present wants, or at least holding themselves in readiness to buy should an advance be determined upon. Whatever the result, an advance is practically realized by operators in some instances. The Lehigh Valley, for example, will not sell at the prices quoted a week ago. Pea and Buckwheat are in better supply and easier; Pea at $2.60, f.o.b, and Buckwheat about $2; Egg and Broken, $3.90. The fact appears to be that while the companies all around have been shading the schedule for Stove, which is $4.15 ₱ ton, the disposition now is to stand out for full prices, and if the advance, as predicted by some, will be only "on paper," it will at least peg up prices to the old circular. At the same time, some of the companies have coal on hand which may be dumped on the market if nothing better can be done.

Bituminous Coal is firmer, especially Clearfield. Cumberland is about $3.10, f.o.b., and Clearfield averages $2.85. The question of railroad tolls causes some irregularity, as they are considered too high, and relief in this respect is hoped for.

Chicago Report.

Scrap.—The local market is stagnant and Old Material is very abundant. Dealers have been buying lately at the following rates :

	Per net ton.	Per lb
No. 1 Wrought Scrap	$12.00	....
Machinery Cast	9.00	....
Malleable Cast	7.00	....
Stove Plate (free of burnt)	6.50	....
Burnt Iron and Grate Bars	4.00	....
Sheet Iron and Hoops	3.00	....
Plow Steel and Breaking Stock	8.00	....
No. 2, such as Shovels, Hoes, &c	4.50	....
Old Boilers—whole (Iron)	7.00	....
" (Iron)—cut in single Sheets and Rings	10.00	....
Old Gas-Pipe and Boiler Tubes	7.50	....
Cast Borings	4.00	....
Turnings	5.50	....
Horseshoes	12 00	....
Copper Bottoms	....	8¢
Copper Clips and Heavy	....	9 ¢
Heavy Brass	....	8 ¢
Light Brass	....	4 ¢
Pipe Lead	....	3 ¢
Tea Lead	....	2¾¢
Zinc	....	3 ¢
Rubber	....	2¾¢

Anthracite.—A continued movement in stocking up is reported among the dealers, but consumers have not yet begun to buy. We continue to quote carload lots of 12 net tons as follows:

	Egg, Grate.	Sto. and Ch.
Chicago, Ill	$5.35	$5.60
Milwaukee, Wis	5.35	5 60
Kansas City, Mo	8 55	8 80
Council Bluffs, Iowa	8.55	8 80
Lincoln, Neb	8.70	8 95
Sioux City, Iowa	8.55	8 80
Aberdeen, S. Dak	8.60	8 85
Dubuque, Iowa	6.65	6 90
Madison, Wis	6.85	7.10
St. Paul, Minn	7.85	8.10
Burlington, Iowa	6.85	7.10
Des Moines, Iowa	8.30	8 55
Davenport, Iowa	6.65	6.90
St. Joseph, Mo	8.55	8 80
Leavenworth, Kan	8.55	8 80
Omaha, Neb	8.55	8 80

Colorado Anthracite.

COLORADO FUEL & IRON COMPANY.

Denver	$8.00
Pueblo	8.00
Colorado Springs	8.00
Leadville	8.00
Cheyenne, Wyo	10.00
All points between Denver and Missouri River	9.35

THE GILBERT & BENNETT MFG. COMPANY of Georgetown, Conn., New York City and Chicago, are well represented at the World's Fair. In the Manufactures Building they have an exhibit which includes Gold, Silver, Brass, Copper, Galvanized and Pearl Wire Cloth (over 100 kinds), Galvanized Netting, Wire Fencing, Gates, ornamental Wire Work, Screens, sample of first Netting made in America by power machinery, which has been exposed over 25 years in the open air, also Woven Fencing used equally as long, house furnishing Wire Goods, and a large variety of articles made of Wire. They have another in the Horticultural Building, where they show a Wire Summer House, patent Knockdown Flower Stands, Chairs, Settees, Flower Trellises, Vine Trainers, ornamental Fences, Gates, Tree Guards, Flower and Lawn Guards, &c. At the Terminal Railway Station can be seen about 3 miles of Woven Fencing made by the Gilbert & Bennett Mfg. Company, used to inclose and divide the railroads; also, 8 acres of "G & B" Netting was purchased by the World's Columbian Exposition to suspend under the glass roofs in various buildings to prevent glass from falling that accidentally might become dislodged. About June 1 they will have ready an artistic publication giving a history of their works, with fine illustrations of methods of manufacture, &c., which will be distributed free as a souvenir commemorative not only of the World's Fair, but also of their seventy-fifth year as manufacturers.

ANNOUNCEMENT IS MADE that the Plumb & Lewis Mfg. Company, Grand Rapids, Mich., have sold the patents, trade-mark and good will of their Wringer business to the American Wringer Company, 99 Chambers street, New York, who will hereafter supply the trade with the Gem and other Wringers heretofore manufactured by the former company. It is stated that the high quality of the Gem Wringer will be maintained by the American Wringer Company, who also announce that they are manufacturing their own rubber rolls and are thus in a position to furnish Wringers of all kinds at the lowest possible prices. The Plumb & Lewis Mfg. Co. will continue the manufacture of Carpet Sweepers as heretofore.

CONDITION OF THE

Hardware Trade.

THE VOLUME OF BUSINESS is moderate, some leading houses referring to it as exceptionally quiet. Manufacturers, also, in most cases report a decided falling off in orders and are making their preparations for the summer dullness. In some lines, however, there is still an excellent demand and manufacturers are full of orders. Prices are without important change, and are, as a rule, lower than a year ago. While manufacturers are disposed to complain of narrow margins, it is gratifying to note that many of them are doing a profitable business, as evidenced by regular dividends. There is much complaint in regard to collections and a conservative course is being pursued in regard to credits.

Advices from Chicago.—The Shelf Hardware trade has improved owing to better weather. The Northwest was visited by balmy winds the past week, and orders consequently show a distinct improvement. Packing floors here are more fully covered than they have been for the two or three weeks previous. The demand for Lawn Mowers and other garden tools has grown decidedly. Refrigerators, Screen Doors, &c., are moving very freely; Screen Doors particularly are in very short supply. Wire Cloth is firm at $1.75. Poultry Netting is now quoted by jobbers at discount 75 and 10 per cent. Some heavy transactions in Tin Plate have occurred during the week. One order placed by a packing house called for 25,000 boxes, the contract having been secured by a local importing firm against the competition of leading importers in other parts of the country. Heavy Hardware is only moderately active, but the volume of business is really better than at the corresponding time last year, as this section of the country was then passing through a period of continuous rains which severely affected trade. Collections are rather slow, but no worse than they have been.

Notes on Prices.

Cut Nails.—The Cut Nail market is sluggish, with a moderate demand. Quotations are unchanged, being in the East on a basis of $1.10 for carload lots at mill, from which price, however, concessions are made in some cases. Small lots from store in New York are held at $1.35 @ $1.40. In view of the present unsatisfactory condition of things, and the prospect of light trade during the next month or two, some of the mills are making preparation to shut down, and it is thought that this will be done earlier and for a longer time than usual.

Advices from Chicago.—Wheeling and other Nail centers are again competing quite aggressively for a share of

the Steel Cut-Nail trade of this locality. The inducements offered, however, are not so large as in former times, when a cut of 5 cents per keg was common. A cent or two is now enough to influence an order. Prices for factory lots have been reduced to $1.25 to $1.30, Chicago. These prices, however, are not so cheap as they seem to be, because manufacturers are unwilling to take orders for base Nails for any considerable quantity. Prices on small lots from stock are continued at $1.35 to $1.40.

Wire Nails.—Wire Nails are regularly quoted at $1.50 for carload lots at mill, but in some cases $1.45 is obtainable. The volume of business is moderate and the tone of the market is not buoyant.

Advices from Chicago.—Exaggerated reports of stocks of Wire Nails in manufacturers' hands are in circulation and efforts are being made to counteract the effects of such rumors. Prices on factory lots are somewhat easier and $1.50, Chicago, is quite a general quotation. Carload lots, however, are selling at $1.55. A somewhat better feeling exists among manufacturers, notwithstanding the lower prices. Orders have begun to come in again and not a few buyers are telegraphing, so as to secure prompt shipment. A considerably better trade is expected in June, when many contracts now being filled will have run out. Jobbers report Wire Nails a little easier from stock, and while $1.65 to $1.70 are regular quotations, good buyers can shade them to some extent.

Barb Wire.—The Barb Wire market has developed no new features since our last report. The demand is moderate and prices steady. We quote $2.45 to $2.50 for Four Point Galvanized in carload lots at mill. Small lots delivered in New York are quoted at $2.70 for Galvanized and $2.30 for Painted.

Advices from Chicago.—Manufacturers of Barb Wire have felt the influence of the better weather of the past week in the increased volume of business with which they have been favored. Trade, however, is very much below what they would like to have at this time of the year. They report no change in quotations, but continue to sell factory lots of Painted at $2.20 and Galvanized at $2.60. Jobbers have also enjoyed a better trade in this branch and quote prices steady at $2.30 to $2.70 respectively.

Grass Catcher.—Cleveland Novelty Company, Cleveland, Ohio, for whom the Ross & Fuller Association, 33 Chambers street, New York, are agents, are selling their Eureka and Bieder Grass Catchers at the prices given below:

	Per dozen.
Eureka	$6.50
Bieder, No. 7	8.00
Bieder, No. 13, for high wheel Mowers	12.00

Cataract Window Brush.—Enterprise Brush Company, 17-21 College place, New York, are manufacturing this Brush, which they are selling to the trade at $8 per dozen.

Saw-Filing Attachment. — Henry Disston & Sons, Philadelphia, are selling the Ball and Socket Clamp, with file and filing attachment, at $1.75.

Puritan Coffee Pots.—The Puritan Coffee Pots, manufactured by Bronson Supply Company, 72 Beekman street, New York, are sold subject to a discount of 25 per cent. from the following list:

No.	20	30	40	50
Pints.	2	3	4	5
Per dozen	$6.50	7.50	9.00	10.50

Wrought-Iron Pipe.—This market shows some indication of improvement and prices are a shade stronger than they have been. A number of heavy orders have recently been received and the mills are well occupied.

Jack Chain.—The manufacturers of Jack Chain have made a reduction in their prices, as they are giving somewhat larger discounts from the new list, which was adopted March 10, 1893.

Mrs. Potts' Sad Irons.—Enterprise Mfg. Company, Philadelphia, announce that all prices and quotations heretofore made on Mrs. Potts' Sad Irons are withdrawn, and that a new list will be issued in a few days.

Screen Wire Cloth.—The supply of Screen Wire Cloth continues quite insufficient for the demand, and those having stocks on hand are in a position to realize a handsome profit. There is a good deal of unevenness in the prices at which goods are sold, prices in some cases, we are advised, reaching as high a figure as $2.50 or even $3 per 100 feet. A quotation of $1.75 to $2 is more general. It is thought that the market will soon be relieved, as the Clinton Wire Cloth Company hope soon to be in a position to put some on the market.

Glass.—There have been no developments in the Glass market of especial interest during the past week, nor have there been any changes in prices. Trade with jobbers remains comparatively quiet, the demand being limited to present requirements, which do not increase with more favorable weather. Business in this line seems to be about where it was several weeks ago, and may be considered satisfactory, everything being taken into consideration. It is understood that additional members have been secured to the National Window Glass Company, from Baltimore, and that in the Philadelphia market established prices are being more closely adhered to. Various factories are closing each week, and will continue to do so until July 1, thus reducing the production of Glass. The fact that present stocks are not large, taken in connection with decreased production, points to a scarcity, especially in desirable sizes, and a possible increase in prices. Imported Glass remains in the condition reported last week, showing no improvement in demand or price. The unfavorable spring weather has had a depressing effect on Plate Glass; so much so, in fact, that the demand for it is exceedingly limited. It is reported by a Pittsburgh paper devoted to the Glass interest that the Kokomo and Elwood factories of the Diamond Plate Glass Company, the Charleroi Plate Glass Company, Charleroi, Pa., and Crystal City Plate Glass Company, of Crystal City, Mo., have become part of the National Plate Glass Company, and that last week these factories were shut down to allow of an inventory of stock and properties to be taken, preparatory to turning them over to the new company. This new concentration of capital may be able to reduce stocks and hold up prices, at least to such an extent as to improve the present condition of the market. It is understood that Plate Glass jobbers from all points west of the Alleghenies to the Pacific slope recently met in Chicago and organized the Western Plate Glass Jobbers' Association, with headquarters at Chicago. It is stated that the object of the new association is to maintain prices and to be prepared, if necessary, for any move the manufacturers may make that would be prejudicial to the interests of jobbers, but that the jobbers are disposed to act in harmony with the manufacturers. Quotations are as follows: American Window Glass, 2000 boxes at one time, 80 and 10 and 10 per cent. discount; carloads, 400 boxes, 80 and 15 per cent. discount; less quantities than carloads, 80 and 10 per cent. discount. Freight allowed on car lots and over, not to exceed 17½ cents per 100 pounds; less than car lots, f.o.b. at shipping point. French Window Glass, 75 and 10 and 5 per cent. discount. American Plate ranges in price from 50 and 10 and 7½ per cent. discount to 60 and 5 per cent. discount. Imported Plate Glass, 60 per cent. discount to 60 and 10 and 5 per cent. discount.

Old Rubber.—The following are the current prices paid for Old Rubber delivered in New York:

Car Springs, ton lots, ℔ lb.	@	$0.03½
Rubber Shoes, ton lots ℔ lb.	@	.04
Large Hose, ℔ ton	@	9.00

Trade Notes.

CURTIS & CURTIS, Bridgeport, Conn., report business very good. They are intending to erect an additional building which will nearly double the capacity of their plant. The building will be equipped with the latest and most approved tools and machinery in this line.

BALDWIN REFRIGERATOR COMPANY, Burlington, Vt., advise us that for the past two seasons they have had all they could do to fill orders and state that at the present time they are unable to turn out goods fast enough to meet the demand, although they have been running their factory for months past to its full capacity.

SHEPARD HARDWARE COMPANY, Buffalo, N. Y., whose plant was destroyed by fire a short time since, advise us that they have received inquiries as to whether their well-known Lightning Ice Cream Freezers will be on the market for 1894, and desire us to state for the information of the trade that the Lightning Freezers will certainly be made and offered to the trade in ample time for the season of 1894. The company are still occupied in making up statement of loss for the insurance companies.

THE PLUME & ATWOOD MFG. COMPANY, 18 Murray street, New York, have now their new line of table and banquet central-draft Lamps ready for the inspection of buyers. They are made in numerous shapes and styles and finished in gilt, nickel, silver, black, oxidized copper, satin silver and satin gold finishes. A number of them are made with onyx, joining the base and founts. There is also a new patent lighting lift, which has recently been added to the burner as formerly made.

W. R. WALKLEY, of Peck, Stow & Wilcox Company, has been invited to prepare and read a poem before the Phi Beta Kappa Society on the occasion of the one hundred and tenth annual commencement of Dickinson College, Carlisle, Pa. Hon. A. K. McClure, editor of the Philadelphia *Times*, will deliver the oration of the evening, immediately preceding Mr. Walkley. The exercises will be held in Basler Memorial Hall. Rev. George E. Reed, D.D., LL.D., formerly of Brooklyn, N. Y., is president of the college.

THE LUDLOW-SAYLOR WIRE CO., St. Louis, Mo., are sending to the trade a very handsome catalogue containing illustrations of work made in their art metal department, which is comprehensive in form, and will prove welcome wherever received. The catalogue in question is 10 x 15 inches in size, handsomely bound in heavy cardboard covers, and printed upon a high grade of paper. The first six pages contain engravings made from photographs of outdoor work, in which are included artistic Wrought Iron Gates and Posts, Lamp and Electric Light Posts, boulevard Gates and Fences, bank Gates and entrance Gates to office buildings, &c. Then in succession follow artistic Iron Lamps, Grilles, bank Counter and Partition Railings, Iron Balustrades, theater trimmings, such as Foot Rails, Proscenium Railings, &c., elevator inclosures and Cages, Hinge Plates made from original designs, fancy Fire Screens and Fenders, &c. The last pages of the catalogue are devoted to views of the Chemical National Bank and Commercial Bank of St. Louis, showing Railings, Partition and general inside furnishings which were supplied by this company.

THE NEW FACTORY of Waddel Wooden Ware Works, Greenfield, Ohio, is now in active operation, and we are advised that Cash Registers, Money Drawers, Automatic Registers, Ideal Coffee Mills, Animal Traps, Inktsands, Toys, &c., are now being made and will be placed upon the market at once. Jno. M. Waddel, who established the Jno. M. Waddel Mfg. Company, who were recently succeeded by the Sun Mfg. Company, informs us that he is the sole owner and manager of the new company. He states that nothing but first-class goods will be turned out, and that the chief characteristics of the manufactured articles will be novel ideas with convenient features.

THE SNEAD & CO. IRON WORKS, Louisville, Ky., and Chicago, Ill., have issued 22 plates handsomely illustrating ornamental iron work, showing what the company have done and what they are prepared to do in that line. The illustrations are of artistic stair railings, grille work, bank railings, doors and arches, gates, arched doors, winding stairs, andirons, hinges, &c. The plates are bound in book form. The company state that they are prepared to make the finest castings and to do the best forged work, to finish by electro plating or by either of the rustless processes, to execute examples in galvanoplastic and to furnish designs when required. A separate catalogue is devoted to book stack and shelving for libraries, of which they are making a specialty. All the parts of this work, including the shelves, are of iron, thus constructing, it is stated, a library entirely fireproof and rendering valuable works safe almost beyond peradventure.

THE EXCELSIOR STEEL FURNACE COMPANY of Chicago have recently issued to the trade a very elaborate catalogue on which they have expended over $3000. In order to keep the catalogue up to date and to avoid the necessity of spending such a large sum another year on a new catalogue, the company have conceived the idea of issuing from time to time a bulletin in which to chronicle the changes and improvements in their line of heating specialties and to make such announcements as may be necessary. A copy of No. 1 of this bulletin, bearing date of May 22, which has reached us, is a four-page affair with pages similar in size to those of the catalogue referred to and of which it is expected to become a part, as a request is made therein that this bulletin be placed in rear of catalogue, and thus the catalogue can be revised up to the latest possible date. The bulletin is devoted chiefly to the Excelsior hot-air damper, which has just been brought out by the Excelsior Steel Furnace Company. In addition to this the company call attention to some minor changes in sizes of their goods and improvements in the same, and also to the fact that they have on hand a large supply of very fine hammered steel Tin Plates, coke finish, which they are supplying to the trade at very favorable figures. The idea of this bulletin is a good one, and those dealers on the mailing list of the Excelsior Steel Furnace Company will doubtless welcome its coming from time to time.

G. A. CROSBY & CO., 176 and 178 South Clinton street, Chicago, have just issued a fine catalogue of presses, dies and special machinery, particularly adapted to the use of canners and packers. This catalogue comprises 48 pages of illustrations and descriptive matter, but the firm state that the list of machinery and appliances given comprises only a small portion of their regular line of manufactures. They have confined the publication to such goods as they consider of special interest to canners and packers who are manufacturing their own packages or contemplate doing so. The machinery covered comprises power presses, lever presses, foot squaring shears, power and hand forming rolls, double headed and upright power crimpers, adjustable bar folders, soldering frames and cylinders, solder holds, rotary solder kettles, solder melting kettles, patent foot forming machines, foot and power squeezers, gang soldering machines, capping machines, capping irons and steels, Star patent coppers, Merriam's patent floating or soldering machines, gasoline and air tanks, power and hand air pumps, fire pots and gasoline burners, &c. They also handle Clark's kerosene oil heater, for use in heating soldering irons in large factories, the system of using which is fully illustrated and described. Special attention is paid to fruit-can factory outfits. The other lines of machinery manufactured by the company are treated in another catalogue, a new edition of which is now in preparation.

A FOUR-PAGE CIRCULAR issued by the Star Baker Company, Belleville, Ohio, illustrates and describes the Columbia Roaster and Baker manufactured and recently placed on the market by them. The utensil consists of two Steel Pans of equal size, with metal projections running lengthwise of the Pan, strengthening the bottom and keeping the Pan off the floor of the oven, while allowing a free circulation of air around it. The Pans can be attached to each other so that the heat and steam are retained inside and the food, it is claimed, does not become dry and hard. A further feature of the Columbia is a Grate fixed in the Pan, by means of which the meat is kept out of the water and fat at the bottom and does not sodden. Full directions are given for its use in the case of various articles of food.

E. J. KNOWLTON, Ann Arbor, Mich., issues a little circular illustrating and describing Knowlton's bathing apparatus known under the name of the Universal Bath. A variety of illustrations are presented, showing the application of this device and its merits are pointed out. A list of testimonials is appended.

THE BAILEY-FARRELL MFG. COMPANY, Pittsburgh, Pa., send out an advertising circular relating to "S. S. S.," the initials standing for Sure Satisfaction Solder. The announcement is made in an entertaining way and will attract attention.

FRANK CLAUDAT has an old-established jobbing brass and bronze foundry at 446 West Sixteenth street, New York, where he is making a specialty of ornamental castings in those metals. Some small castings turned out by him in the way of Lamp Bases, Decorative Plates, &c., display considerable artistic merit. Special mention may be made of some spirited animal figures for clock ornaments or paper weights, which are of unusual excellence. Mr. Claudat is a Frenchman who has had an art training which he has put to a good use during an experience of 30 years in the brass foundry business.

THE SAFETY FURNACE PIPE COMPANY, Detroit, Mich., distribute a serviceable catalogue relating to the special Hot-Air Pipe of their manufacture. Illustrations show the fittings. Price lists are presented and a very ingenious plan of illustrating the different combinations of pipe and fittings by means of pages cut in the middle is adopted at the back of the book.

AN INCREASING DEMAND for high-grade Tinners' Tools and Machines finds the present plant of Jacob Brombacher's Sons at 30 Cliff street, New York, too cramped. A fine manufacturing building has been secured at Fulton and Front streets, Brooklyn, and in the near future a plant will be put in operation having increased facilities and under careful supervision the quality of the output will be maintained at the top notch of excellence.

THE LISK MFG. COMPANY, Limited, makers of anti rusting tinware, have recently removed their manufacturing establishment to Canandaigua, N. Y., where they have purchased extensive grounds and erected a large factory adjoining the various lines of railroads. In their new illustrated catalogue, with which we have been favored, the company state that they are now able to make better wares and more of them than was possible under the old conditions, and that they use only the best materials in their manufactures, the tin plate being the highest grade, IX, IXX and IXXX. All their goods are guaranteed not to rust. The catalogue just issued by the concern is a 50-page pamphlet, with red and gold paper cover. A view of the new works is given as a frontispicce, and the various wares made therein are fully illustrated in the pages. These include Anti-Rusting Pails, Dippers, Measures, Wash Basins, Tea Kettles, Boilers, Bathtubs, Slop Jars, Dish Pans, Oil Cans, Tea and Coffee Pots, Roasters, Stew Pans and other domestic and culinary utensils.

THOMAS MÜLLER & SON, 104 Centre street, New York, who make Sheet-Metal hotel, restaurant and bar appliances, Hot-Water Urns, Tea and Coffee Urns, Measures and Funnels, have hung out a new sign and put out a showcase of fine samples of their work.

THOMAS CARLIN'S SONS, Allegheny, Pa., "F" catalogue, just issued, illustrates the extensive line of sewer castings and gutter crossings manufactured by them. These include cast-iron inlets, trap plates, man holes, ladder irons, stop cock frames and lids, &c. The catalogue also gives a partial list, with illustrations, of the firm's Road Rollers, Crushers and Contractors' Tools, together with Pumps and Stationary Engines and Boilers, made and sold by them. A separate four-page circular calls attention to the firm's Locomotives and Road Engines, also Hoisting Engines and Machinery and Derricks. The class A, Link-Motion, Reversible Hoisting Engine, consisting of a marine vertical engine, positively connected to a drum by means of strong, heavy gearing, and so arranged that the load is held easily under control by means of a reversing lever and foot brake, is an article offered by the firm which is claimed to have special recommendations.

THE E. J. MANVILLE MACHINE COMPANY, Waterbury, Conn., well-known as manufacturers of special Wire-Forming Machines, are also makers of a large line of Power Presses, which may be arranged for special work. In their advertisment on another page is shown their double-action Cam Press, which is one of the many styles made by them.

GILBERT & SHERIDAN recently formed a copartnership at 48 Centre street, New York. Both members have previously had a wide experience and will act as manufacturers' agents, exporting and dealing in Hardware, Machinists' and Mill Supplies. They have placed a number of substantial orders for Tinners' Tools and Machines in the Canadas, New Brunswick and Newfoundland. Emery Wheels and Grinding Machinery will be one of their specialties.

THE NEW JERSEY IRON & METAL COMPANY of Paterson, N. J., handle several hundred carloads of old and new metal and old machinery during a year, gathering from all sources. The disposition of it is of some interest. The castings naturally drift to the foundry and the wrought iron to the forge, but old hoop iron, borings and turnings leave the mechanical trades altogether, being used for refining gas, for the production of chemicals, and large quantities being used for making black dyes.

SCRAP.

SAVE A FEW TONS COMING from Devonshire all the tin of Great Britain is from the mines of Cornwall. The ore occurs in veins both in the granite and the overlying slate. No alluvial deposits are worked at the present day. The Cornish mines are probably the oldest worked tin deposits in the world, traces of Phœnician operations there before the Christian era having been clearly established. The tin obtained from Cornwall is not used in the manfuacture of tin-plates, not being as suitable for that purpose as the metal mined in the Straits settlements and Australia.

THE BRITISH TIN-PLATE INDUSTRY is reported as quiet. Returns for April show about the same amount of tin and terne plates exported to the United States as last year during the same month. Strikes and labor controversies as to limitation of production have marked the last few weeks among the Welsh works.

A LARGE TIN PLATE WORKS has been erected in France at Besse Indre, near the city of Nantes, by Messrs. Langloise & Lintz. A number of Welsh tin platers have left for France to start the new mills. Italy has already one or two tin-plate works, and it is said that, encouraged by American success in this direction, other works are likely to be erected on the Continent of Europe.

THE LONG DROUGHT IN ENGLAND has led to the stoppage of several tin-plate mills for want of water.

A Word to Correspondents.

A very excellent pattern maker used to say, "I do not care how many lines there are in a drawing, provided they mean anything. I may not need them all as a guide to my work, but if I don't need them, they do no harm. What bothers me in the work of too many draftsmen is that *they do not put in lines enough.*" This might be paraphrased to make it apply to letters of correspondents who write to us for information upon various subjects. An editor does not care how many facts are stated, provided they are facts; what bothers him is the unpleasant fact that, generally, there are not facts enough. Any superfluous fact stated may be neglected in answering a query, but if important data are omitted he must either run the risk of error in his reply, or must base his answer upon assumptions. What are assumptions? An assumption may be said to be a guess that something that might possibly be, actually is. An answer based upon an assumption, while entirely correct in itself, may be very far from correct as applied to the particular case about which a correspondent seeks accurate information, yet what can be done when the facts supplied are deficient?

Give all Particulars.

If an inquiry be neglected, the correspondent feels aggrieved; and either something must be assumed or a letter must be written asking for the essential facts omitted before an answer can be given. This extra labor should not be imposed, when, by taking a little more time and pains to state everything completely, even if much that is stated may not be pertinent to the inquiry, the essential facts and conditions are all got in somewhere. If correspondents expect to receive complete and satisfactory answers to their queries, such expectation should rest only upon a complete and satisfactory statement of the facts necessary to an intelligent comprehension of their questions. For instance, if the amount of heating surface necessary to heat a room is asked, tell all about the room, its hight, length, breadth, the kind of building of which it is a part, how situated with reference to other rooms, what side or corner of the house it faces, and what it is used for; also whether steam or hot water is used for heating. Add also the material of which the building is constructed, and the thickness of the walls. Give the number and size of the windows in the room, and state whether the building is much or little exposed to winds. Now, all these are facts essential to be known before an accurate estimate of the surface required can be made. It is not supposable that every one should know them to be essential; but the greater the effort to give all the particulars that the correspondent can think of, the greater the probability that the essentials will be given, whether the inquiry relates to a room to be heated, a pipe for the conveyance of water, a pump, or whatever it may be upon which information is sought.

A Substitute for Litigation.

An institution which promises to be one of great value has just been established in London as a substitute for the expensive litigation which so often attends business disputes in the law courts of England. A Chamber of Arbitration has been organized, and is now a recognized feature of the business life of the British metropolis. Composed of a body of approved arbitrators selected from every branch of trade, from among whom one or more are chosen to hear and decide upon each controversy brought before the chamber, the benefit of this institution to business men is very apparent. The use of this method of settlement is, of course, voluntary, but the advantage of submitting a matter of trade dispute to the judgment of a body of individuals fitted by training and experience to deal with the subject is one which will not be overlooked. The system has already been tried with the best results in Australia, and there is little doubt that the new departure will prove equally acceptable to London business men. The fees are said to be moderate and the forms of procedure simple. At one time, not so very long ago, the possibility of the institution of just such chambers of arbitration was decided as the dream of visionaries, in the same manner as the substitution of international arbitration for war is in some quarters still laughed at. But it has come to pass; and to men in all countries who are sensible enough to see where their best interests lie, such a common-sense, economical method of deciding their business disagreements, in place of the tedious and costly procedures of the law courts, must surely recommend itself as a thing most desirable and to be imitated.

The Value of General Information.

There is a vast difference between merely acquiring information and so storing it away in one's knowledge-box that it will always be at hand for ready reference. Plenty of persons take in large stores of information—frequently, it is true, of that kind which has been aptly termed "instruction ladled out in a hurry"—which, if they were able to systematize and, as it were, properly pigeon-hole it, would be of immense service to them. But the majority of individuals, especially the more ambitious among the young men of the present day, who earnestly desire to improve their minds by the acquirement of wide information, make the mistake of attempting to stow away too much undigested matter. Their aim is to get as much knowledge as possible of a sort which they believe will help them along in their several callings. They pick it up greedily, anywhere and everywhere—often in such big blocks as are impossible of proper assimilation. As a result, their minds shortly lose much of the digestive property, and the information they have taken in becomes so congested and overlaid as to be practically useless to them when required in a hurry. They know all about a thing, but cannot readily connect the relative facts in regard to it. And this, be it understood, applies to technical knowledge as well as to "learning" as popularly understood. The tendency of the day to learn about everything cannot be a true benefit to men of untrained intellect. It is true that a man who drives at being a master of his craft or profession must, in most walks of life to-day, possess a very great deal more information outside of, but in some way touching, his own immediate sphere of work than was at all requisite even 15 or 20 years ago. General information must in some measure be absorbed by the man who wants to rise; but it cannot be of much more than superficial quality. The field is too wide and life too short for the busy man to acquire profound knowledge of general subjects.

Special and General Knowledge.

Science, which is but another name for knowledge, has so enlarged her borders of late years that no ordinary man can hope to grapple with a fraction of the "general information" now abroad. The old question, then, comes

up again: "Which is the more worth while, to know something of a great many subjects, or to be master of one or two—to be, in short, a jack-of-all-trades or an expert in one?" Looking to the financial results achieved by specialists and general practitioners in the professions, most people would, we believe, favor the specialists. And yet there is much to be urged in favor of what is known as "a wide range of information." Dr. Johnson, of dictionary fame, who himself possessed more general information than most men of his day, used to say that there are two kinds of knowledge—that which we know ourselves and that upon which we know where we can find information. It is perhaps most desirable to possess some knowledge absolute, directly bearing on one's particular sphere of work, together with a competent mastery of the second sort of knowledge—that is, to know where readily to lay one's hand upon information required and appropriate it as wanted. In other words, a due combination of Johnson's two kinds of knowledge will pay the ordinary man best. An ability to use intelligently the numerous text and reference books on every conceivable subject now published and obtainable at moderate cost, or which are to be found in most public libraries, places one who has a competent knowledge of his own special calling in a far better position than he would probably hold did he attempt to memorize a great quantity of general information instead of learning thoroughly his particular trade.

A Bankers' Panic.

The severe curtailment of banking accommodations is unnecessarily intensifying commercial distress. Banks everywhere seem to have adopted the policy of refusing to discount paper except for their very best customers, and refusing to renew discounts except under very special circumstances. They are ostensibly fortifying themselves against possible sudden demands from their depositors, and for that reason aim to accumulate a very large percentage of their deposits in actual cash. The legal reserve required by the national banking laws is now far below the limit that bankers are imposing upon themselves. It has become by no means unusual for a bank to have 50 per cent. of its deposits on hand in actual cash, and some bankers are striving to attain $66\frac{2}{3}$ per cent. Taking the country as a whole, there has perhaps never been a time in its history when the banks held so much money in their vaults. Bankers may well claim that the banking institutions of the country are on a very solid basis. Having collected a very large part of the currency of the country, and securely locked it up, they are in an excellent position to claim financial strength.

This strength of the banks, however, is the weakness of manufacturing and commercial interests. The volume of business in general has not shrunk in proportion to the curtailment of banking accommodations. It is not possible for great business operations to suddenly shorten their lines, reduce expenses, discontinue purchasing supplies and stop making preparations for future business. They must go on with their plans for continuing trade on about the same scale, and in about the same way. Many large manufacturers are heavy borrowers at this season, especially those who depend to any great extent on agricultural interests. Later in the year they receive their returns on the outlay they have made and are then amply supplied with funds. Numerous business interests must conduct a genuine campaign, requiring a long period of elaborate and costly preparation, followed by a sharp conflict between salesmen, after which the fruits of victory are collected in the shape of payments by those who have bought the goods. There are trades in which nine months of preparation are necessary for but three months of active business. Manufacturers and merchants in such lines are handicapped by curtailments of banking privileges and their plans may be seriously disarranged. There are also plenty of business houses whose trade has outgrown their capital, but their management is superb and their solvency is never questioned. They must have banking accommodations, however, and when these are heavily curtailed, as at present, there will be embarrassment.

There appears to be a bankers' panic, caused by a few bank failures in various portions of the country, some failures in manufacturing and commercial circles, the great failures in Australia, and the general uneasiness concerning the silver question, together with growing financial stringency in all channels of trade. For the financial stringency the banks themselves seem to be largely responsible. By locking up the greater part of the circulating currency of a community, and sharply restricting credit, the banks of that locality may make themselves very strong, but they make the community itself very weak. Of what advantage is it to the country that the banks are able to report themselves immeasurably better equipped for a panic than ever before, if other business interests are without means to properly conduct their operations? An instance has been brought to our notice in which a bank that boasts of a reserve of 55 per cent. refused to discount a note for $10,000, drawn by a manufacturer of high standing and indorsed by a friend estimated to be worth at least a million dollars. The refusal was accompanied by the emphatic statement that the note would not be discounted if it was secured by ten times its face in Government bonds. This may be a very extreme case, but it illustrates the gravity of the situation from the standpoint of a panic-stricken banker.

Bankers are habitually asking their customers what is the condition of trade, and if the reply is unfavorable they mechanically ask the cause of the dullness or depression, and how soon there will probably be a change. The situation now is rapidly developing such a phase that the answer may soon be returned that the banks are causing the greatest trouble, and until bankers cultivate a fresh crop of confidence there will be no improvement. Caution and conservatism are most excellent qualities at this time, it is true, but there should be moderation and discrimination in the exercise of even such admirable qualities.

Market Quotations.

The enemies of trade journals, says *The Iron Age*, and, unfortunately, many of their friends who entirely mistake their functions, are generally very active in denouncing or reproving them during periods of declining markets. There are a few men in nearly every line of business, sometimes occupying positions of influence, whose one idea is that every buyer is a natural enemy, and that capacity to deal with him is measured by the success attained in deceiving him. This is the man whose business is booming when half his mill is idle, who represents the market as stiffening when he has offers out right and left to sell at unprecedented prices. He is the one who is always eager to pour into the ears of every journalist his tales of general prosperous trade, and of individual success. He is the one who becomes the violent enemy of the trade journal when he finds at last that while his tales are patiently listened to, they never reach the public. He is comparatively harmless, because his reputation protects those whom he attacks.

There are others who hold that the special function of trade journals is to hide bad news as long as possible and proclaim favorable developments with the utmost alacrity. When an advance has taken place it must be chronicled at once. A decline must be kept back, and quotations must remain stationary while still a stray buyer exists who has not heard of the lowering in prices. The true office of the trade journal, according to these critics, is to constitute the rear guard in retreat, and the picket line in every advance.

We hold that it is the function of the commercial reporter to seek the truth persistently and diligently, and to present it fairly and candidly. If developments are unfavorable, the sooner their significance is generally understood the better. It will make the weaker sellers quicker to abandon hope and will make buyers more watchful of their opportunity, thus aiding in steadying the markets. The idea that secrecy was the only safeguard of merchants and manufacturers has been long since abandoned in all the markets of the great staples, such antiquated business methods being now regarded as childish. No one attempts the dangerous and unsatisfactory *rôle* of being the special guardian of any commodity, protecting it against untoward declines, or blowing it up during its brief days of expansion.

TIN PLATES.

Tin Plate Works of A. A. Thomson & Co., New York.

In the list of importers who have within the past two years become manufacturers of tin plates is included the firm of A. A. Thomson & Co., 213 and 215 Water street, New York, who have been long and favorably known in the tin-plate and metal trade of this city. Their tinning works, which are situated at 546 West Sixteenth street, have, until comparatively recently, been run under more or less experimental conditions. For the past few months, however, the plant has been in active operation, turning out a large quantity of various grades of roofing plates, including "Thomson's Puritan," "Central," "Old Colony" and "Durham," most of which names are well known in the market. The works were started under the personal direction of George W. Jaques, a member of the firm, who has been for long familiar with the process of tin-plate manufacture, having made it a special study both in its theoretical and practical aspects. All the labor employed is American. The plant was established and has been run from the first without any extraneous help, and each of the workmen and boys employed has been trained in the establishment. It should be mentioned that the greater proportion of the employees are boys, who, we are told, are able to accomplish quite as much work as the average run of workmen. This circumstance it is which in a great measure enables the firm to keep down the cost of production, and to offer their plates advantageously as to price in competition with the imported article. These boys were, Mr. Jaques says, able to pick up the necessary knowledge and dexterity in a very short space of time, and soon became proficient tin platers. Another advantage gained is the absence of trouble which so often accompanies the employment of skilled labor.

Although as yet of modest size, Thomson & Co.'s establishment is capable of turning out good work and that in some quantity. With their two tinning stacks an average of 800 to 1000 boxes a week are put out. So far production has been confined to roofing plates, for which the firm have had a very gratifying demand, which has caused the works to be for the past few weeks to some extent behind hand with orders, although running night and day. The tinning machines in use are of the Leyshon pattern, with certain alterations and improvements designed by Mr. Jaques, which have resulted in considerably increasing their capacity. In consequence of the pressure of orders it is probable that a third stack will be placed shortly, although the somewhat circumscribed space at their disposal renders many desirable extensions and improvements, which the company have in contemplation, rather difficult to arrange. The principal brands, the production of which in sufficient quantity is now taxing the resources of the establishment to their utmost, are "Thomson's Puritan," a heavily coated roofing plate of superior quality, in the manufacture of which great care is exercised, and "Central," a cheaper terne with moderate coating. The former is claimed to be one of the heaviest and most evenly coated rolled plates made. These plates are very carefully cleaned and assorted, and great pains are taken to keep them up to standard. "Central" is said to be much in request for ordinary work. The necessary power and steam are supplied from a neighboring works, but a small gas engine in the shop is used as an auxiliary and for contingencies. The black sheets hitherto used for coating are imported. The only reason for this, however, is on account of the greater ease of handling the foreign sheets in their boxed condition, whereas native sheets come in bulk, and as yet the works are unsupplied with a side track or facilities for getting carloads into their shops. We are informed that, otherwise, they would greatly prefer using the domestic sheets and will do so as soon as they can obtain the necessary facilities for handling them. The sheets before receiving their coating go through the usual process of white pickling and washing, which is very carefully carried out. Jets of steam are used for creating a circulation in the pickling vat, into which the sheets are placed with a slight layer of sand between each to keep them separate so that the preparation may act equally on every part of their surface. A constant stream of water flows through the swilling vat. Storage tanks then receive the sheets ready for the metal pot. After the tinning process the finished plates are carefully cleaned, sorted, squared and stamped, and are then boxed and shipped. Each day's product is sent out at once, no stock being piled up.

SCRAP.

A PROCESS OF ELECTRO TIN PLATING is the subject of a patent granted to Louis Aronson of New York, who has assigned one-half to James H. Hoffman, also of New York. Referring to the former methods of tin plating by electricity, the specification states that it has been difficult to deposit the tin so that it would adhere to the black iron; another difficulty being that the tin was so soft it was liable to be rubbed off in the process of polishing. Electro-plated tin plate, it is furthermore stated, can be made considerably cheaper than when plated in the ordinary way and would come into use were it not for these defects. The invention referred to is claimed to overcome these difficulties.

IN *Manufacturers' Record* of last week the establishment of six new canning factories is recorded in as many Southern States—namely, one each in Alabama, Florida, Maryland, Mississippi, Tennessee and Texas.

THE UNITED STATES IRON & TIN PLATE MFG. COMPANY, manufacturers of tin and terne plates, are making some changes in their boiler equipment, and also in the method of placing them, which is expected to effect a considerable saving in fuel.

MARSHALL BROS. & Co. of Philadelphia, manufacturers of tin and terne plates, are running their rolling mill at its fullest capacity. They are now supplying black plates to the trade, and the demand in this direction with the requirements of their own business taxes their mill production to the utmost. They are contemplating a large increase in their plant in order to keep up with the demand for their black plates, and it is quite likely that by next fall they will be able to produce 150 tons of plates per week. Their present capacity is about 75 tons.

A LEAFLET distributed by the U. S. Iron & Tin Plate Mfg. Company, Demmler, Pa., advertising their special brand of American tin plates—the "U. S. Bright"—reproduces an article from the editorial columns of *The Metal Worker* of April 22, 1893, on the manufacture of bright plates in this country, with the assertion that such are the plates made by their firm.

INDIA is becoming a larger customer for British tin plate. The manufacture of certain kinds of tinware is carried on in the Punjaub; and a prominent firm at Mooltan is said to import large quantities of tin plate of good quality for the production of dispatch boxes and other japanned wares.

THE PRODUCT OF TERNE PLATES from the works of the Laufman Tin Plate Company, Pittsburgh, for the quarter ended March 31, was 430,466 pounds, as against 321,930 pounds for the previous quarter. A still greater increase is expected for the present three months, when the million mark will possibly be reached. The present average output of the works is reported as 100 boxes, or 22,500 pounds, of 20 x 28 plates per day, which is at the rate of 6,750,000 pounds per annum. The Laufman terne plates are as genuinely American as they can be, being made of black sheets rolled at the company's own works at Apollo, Pa.; the labor, too, is exclusively American, and the only foreign element is the pig tin, which applies equally to Welsh plates.

DANIEL EDWARDS, proprietor of the Dyffryn Steel & Tin Plate Works, Swansea, Wales, completed the final tests of his patent automatic "catcher" toward the end of April, and is, we understand, so satisfied with the complete success attained that he has decided to place the apparatus upon the market shortly as an adjunct to his tinning machines, which, during the past 12 months, have been introduced into Brooklyn, St. Louis and other works.

THE FALLING OFF in the exports of tin plates and pig tin from Great Britain to Canada during the first quarter of this year was most marked. According to official returns the value of tin plates sent to the Dominion during the three months ended March 31 was $117,355, against $222,629 worth during the corresponding period of last year. Pig tin in 1893 shows $7992, as compared with $34,310 in the first quarter of 1891. Lead imported from England also shows a heavy decrease, viz: $2203 in 1893, against $12,197 in 1892.

THE LETTER BOX.

Flow of Air Through Furnace Pipes.

From K. G. R., *Lucknow, Pa.*—I would like to get information on the following points concerning the flow of hot air through 8, 10, 12 and 14 inch tin pipes, with 2 feet elevation in 6 feet of run: What would be the flow at the register face, or does the size of the air pipe make any difference? I believe there is a difference, but how to get at it I do not know. I can get the capacity of pipes and registers and subtract one-third for the fret work on the registers. Is that enough allowance?

Note.—To answer our correspondent in the inverse order in which he puts his questions, we would say that the rule of subtracting one-third of the area from the register face is held by some to be hardly sufficient. A method that has been suggested for determining the actual proportion of fret work to the open space in a register is to lay the register on a smooth board and fill in the openings with seed or shot, or something that will not pack. Then remove the face and arrange the filling material to cover solidly the thickness of the register face. Then measure that area and compare it with the total area of the register. It must be borne in mind, however, that the actual openings in the register face do not determine its capacity, for when the air is broken up into little streams by the fret work its flow is much more retarded than if the total opening area was in a single hole. Returning to our correspondent's inquiry about the flow of air through the pipes he mentions, it is not possible to tell what the flow will be without knowing the temperature. If the cold-air box is wide open on a still day, and there is but little fire in the furnace, the flow will be much more sluggish than if the fire was burning bright, because the hotter the air the quicker it will rise. The difference between the carrying capacities of the pipes is, we think, not very great, provided all of them are of greater area than the area of the register face through which the air must flow to reach the room. That is, the friction on the register face is so much greater than the friction on the surface of the pipes that the difference in the capacity of the three sizes will be inappreciable. It must be borne in mind that the capacity of a pipe, roughly speaking, depends upon the area of the smallest section, the same as the strength of a chain depends upon the strength of the weakest link. So, if the air has to be contracted in volume in going through the register face it is a matter of comparative indifference as to whether the hot-air pipe is 8, 10, 12 or 14 inches in diameter. It is by no means an easy matter to get at the exact capacity of a hot-air pipe by experiment—that is, in cases where the opening is covered by a register face. Many different plans have been tried, with varying success. If the pipe is vertical a good plan is to place an instrument called an anemometer, which is a device for registering the velocity of air currents, in the pipe below the register face and then put the register face in position. By determining the velocity of the air current in that way and multiplying it by the area of the pipe the result should be the quantity of air flowing in at a given time. In the case we mentioned above we assumed that the air box was wide open and that no wind was blowing. Our correspondent will readily understand that by varying the conditions of air box and outside air currents the velocity of hot air in the pipes will change within very wide limits.

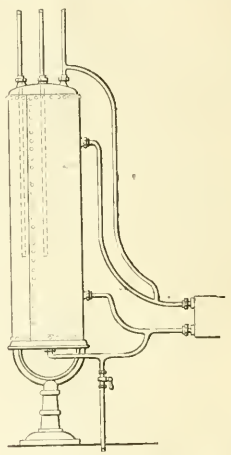
Plating with Aluminum.

From SNIPZ, *Columbus, Ohio.*—Has any process been discovered whereby the polished edges and surface of name plates and other castings can be coated with aluminum, the same as nickel?

Answer.—No satisfactory method of coating iron or other metals with aluminum is given in the text-books. The following is an abstract of an account of the process of electro-aluminum plating, as carried on at the works of the Tacony Iron & Metal Company, Philadelphia, where a quantity of such work is done. Although intended primarily for the coating of large-sized castings, the process is equally applicable to smaller articles. At the Tacony Works six long and deep tanks are used. The article to be plated (in this case a heavy iron column) is placed in tank No. 1, containing a solution of caustic soda, in which it remains 24 hours to clean it of grease. Thence the casting is removed to tank No. 2, where it undergoes pickling for the removal of scale and oxide, remaining 24 hours more. It is then thoroughly cleaned by hand, with steel scratch brushes, preparatory to being placed for a further period of 24 hours in tank No. 3, where it receives a primary deposit of copper. In the fourth tank, to which it is then removed, it receives a very heavy electro deposit of copper, remaining in this tank for 72 hours. This prepares the casting for the reception of its aluminum coating, which is imparted to it in tank No. 5. Here it also rests for 72 hours, an even coating of $\frac{1}{16}$ inch of aluminum being deposited. The last tank to which the plated casting is then removed contains hot water in which the casting is allowed to remain just long enough to be thoroughly washed. The process is then complete, and the article emerges with a "matt" or dead-white finish of aluminum, which can be burnished at will. The lengthy process detailed above was found necessary for the heavy work done at Tacony, but the principle stands good for smaller castings also, of which a number of specimens have been turned out from those works.

Double Pipe Connections for Range Boiler.

From W. B. K., *Boston, Mass.*—In recent issues of *The Metal Worker* you have given sketches of different ways of setting range boilers. Four years ago I was sent to a town in New Hampshire to add a few more fixtures to the work that was in the house. It was here that I saw a boiler setting, of which I send a sketch. It was a fine piece of work, $\frac{7}{8}$-inch brass tubing, union bends on boiler and range, the pipes all bent to fit, and no ells. It was the nicest piece of work I have ever seen. Will you please tell me what advantage this way has over the usual way of setting boilers, or if it was done for looks only?



Double Pipe Connections for Range Boiler.

Note.—The accompanying engraving was made from our correspondent's sketch, and shows the double system of connecting the water back and boiler. We fail to see, however, what particular advantage is to be gained by doubling the pipes in the way shown. The natural circulation will be through the lowest and highest pipes—that is, the water from the bottom of the boiler will enter the bottom

pipe to the range water back, and returning, will rise through the top pipe above the boiler. If each of the two pipes from the water back to the points where the double pipes begin was of a capacity equivalent to the combined capacity of the two pipes, then there would be circulation through all four pipes. But we assume, and in fact our correspondent says, that $\frac{7}{8}$-inch pipe is used throughout. We cannot see, therefore, what good purpose the doubling of the pipes will secure.

Forms for Estimating Blanks.

From F. S., *Philadelphia.*—Can you or your readers help me in getting up a blank for estimating on furnace and range work and tin roofing that can be bound in book form for reference, and itemized or arranged so as to guard against omitting anything that should be counted in an estimate.

In furnace work, castings, sheet-iron work, smoke pipe, registers, hot-air pipe, &c.

In range work, range, water back, boiler and stand pipe, plumbers' connections, &c.

In roofing material, getting it ready, putting it on, solder, charcoal, &c.

No doubt some one in the trade has a better system of estimating than mine, and if given it will be of value to others besides myself.

Note.—Doubtless the forms used by any one could be changed more or less to suit our correspondent's case. We refer him to page 72 of *The Metal Worker* of April 8, which describes and shows part of just such a blank used by the customers of the Excelsior Furnace Company of Chicago, Ill. Most of the large manufacturers of furnaces and ranges have some sort of a blank form, samples of which could easily be secured by writing for them. A plan that has been followed by some dealers with satisfaction is to take good manila wrapping paper and sew through the crease with strong thread, making a book of about 48 pages and 18 x 24 inches in size, though some prefer to fold the paper once more and make the book 12 x 18 inches. In using the book, on the right-hand page a plan of the first floor is drawn to a scale of $\frac{1}{8}$ or $\frac{1}{4}$ inch to the foot and on this plan the various registers and flues are located, and the furnace, with air duct, smoke pipe, hot-air pipes and chimney, all are plainly marked and drawn. The plans of the upper stories are either omitted or drawn roughly as memoranda. When drawn, however, there is less liability of leaving out some stack of pipe, or register or damper. On the left-hand page the name of owner and address of the property is recorded, and then for convenience the page is ruled with two $\frac{1}{2}$-inch columns on the extreme left and with three $\frac{3}{4}$-inch columns on the extreme right. The word "cellar" is written at the top of the wide column and under it all that is used in the cellar, beginning with two No. 280 sanitary air-warmer castings. List, $100. Cost, $87.50. Sells, $105.00. Then give lumber and carpenter work for air duct; bricks, mortar and mason work for foundation: smoke pipe and everything except hot-air pipes. Then take each room separately under its name. For instance, under Hall, one 8-inch collar on furnace, 10 feet of 8-inch IX tin pipe, one 8-inch hot-air damper, one 8 x 10 IX tin register box, one 8 x 10 nickel-plated register, 2 sheets 14 x 20 tin protecting joists, &c.

By following this method, with a plan of the building on the opposite page for a reminder, every room is taken in turn and each detail of the work is followed, so that the probability of some item being overlooked is very small. If the cost is kept by cost marks, the book can be used in after years not only as a reference but also as an aid in selling, by showing a customer houses similar to his own that you have heated and how it is done, the effect of which can be intensified by having a letter expressing satisfaction from the owner pinned to the page. It also is an excellent school for the apprentice that you have agreed to teach the trade, and before his time is out you will reap the benefit of having such a book if it is well kept.

Some similar plan, no doubt, can be reported by some of our range and roofing readers, which, no doubt, will be appreciated by many besides the inquirer.

Bolted Pump Cylinders.

From J. A. B., *Riverhead, N. Y.*—Many readers of *The Metal Worker* have undoubtedly experienced more or less trouble in re-leathering the bolted pump cylinders and found that the bolts are made too short. As they come from the factory these cylinders are neatly bolted and when screwed down the nuts are flush with the threads. As repairs are needed, oftentimes thicker leather and better stock is used, the result being that the greater thickness shortens the bolts and the threads are stripped. Far away from a blacksmith the workman is compelled to return to his home, wishing that the manufacturer who made the pump cylinders could have some of his everyday experience. How much better it would be if all the bolts for the pump cylinders would be made longer so as to do the service that is required of them without stripping.

— —

Lead Burning.

From J. P. B.—What process is employed for joining lead, or soldering lead with lead, and what kind of acid is used for the work?

Answer.—In lead burning, as it is called, which is the process of joining lead with lead, hydrogen gas is generated in a properly constructed apparatus, and used in connection with air supplied by a bellows, blast or air tank. A rubber tube supplies hydrogen gas from the generator and a similar tube supplies atmospheric air from a proper receptacle. The two pipes meet at a three-way stop cock, to which is connected a third pipe provided with a burner to give a suitable flame. In soldering by the aid of this flame no acid or flux is used. The edges of the work are brought together, scraped clean, and a small bar of lead, also scraped clean, used in place of solder. The hydrogen is ignited, and size of flame regulated by means of the stop cocks connecting the pipes, thus allowing the proper amount of air and gas to mingle until a clear bluish flame is produced. The point of the flame is then held over the seam, and a small quantity of the strip lead melted off and melted into the seam. This operation is repeated after the general method of blow-pipe soldering until the seam is completed. For a description of apparatus and process used in lead burning, see *The Metal Worker* of September 3, 1892.

Tin Roofs.

From B. B., *Ashley, Ohio.*—I would like to have an expression of opinion from the readers of *The Metal Worker* regarding the laying of tin roofs on large buildings. Supposing a building to be 80 or 100 feet deep, and the roof has a fall of $\frac{3}{4}$ or 1 inch to the foot. If the tin roof is laid with a standing seam, during such severe winters as the past the snow is liable to collect in considerable quantities on the roof, and, as it melts from underneath, the water is liable to find its way through the seams. Would it not be better to lay such roofs with flat seams, which, being soldered, would prevent all danger of leakage?

Note.—Many roofs of the size and fall mentioned that have been put on with standing seam are in existence and are in every way satisfactory. The secret is: 1, in stopping the standing seams at a point where it is impossible for the water in the valley or gutter to rise and flood them and continuing with flat seams to the gutter; 2, in closing the standing seams tightly in such a roof. Some tinners prefer to go over the seams with a hand groover after the machine and make them surely tight. Where such care is observed trouble seldom results. Where the fall of the roof is so little as in this case, to get back far enough with the seams to keep them out of danger might leave but a small portion of the roof for standing seams and make extra labor by changing from one style to the other.

Gutter Trough.

From C. H. M., *Ohio.*—Somewhere in these great United States there is manufactured a trough for soldering together 5$\frac{1}{2}$-inch gutter. Can you tell me where it is, so that I can get one?

Note.—On inquiry we fail to find trace of the trough mentioned, though some reader may be able to give the information. We find as a rule the troughs used are home made and in every way satisfactory.

Micrometer Calipers.

From C. F. S., *Trenton, Tenn.*—Please inform me through the columns of *The Metal Worker* what kind of micrometer calipers are suitable for tin-shop use.

Answer.—Micrometer calipers that would fulfill our correspondent's requirements are manufactured by the Brown & Sharpe Mfg. Company, Providence, R. I., and L. S. Starrett, Athol, Mass.

WORLD'S FAIR NOTES.

Installation Nearing an End.

There will always be a few people behindhand. Perhaps in July the sound of hammers and saw may be heard in some one of the buildings, showing that a belated exhibitor is at last getting something in shape. The work accomplished last week, however, brought forth many noticeable changes in sections that on the opening day were so far behind it then seemed impossible to get them in shape much before the middle of June. Great progress has been made in the Electricity Building. The entire floor is now covered with installed exhibits in various stages of completion, and a formal opening is to be made this week.

In Manufactures Building there are a great many boxes yet to be unpacked, but the entire exhibit is rapidly taking shape. The Russians have the frame work of their pavilion practically in place. The Norway pavilion is ready for the painters and decorators. Denmark will be prepared to receive visitors in a few days, and the Canadian exhibit is far advanced compared with what it was a week ago. Having completed the exterior decorations of their pavilion, the French are exerting themselves in the work of installing goods.

Most of the State pavilions in the Agricultural Building have been completed and in a majority of them the exhibits are in shape. Russia, Spain, Brazil and the Argentine Republic are considerably behind, but they have large forces of men employed, and are pushing the work. Washington, South Dakota, Kansas, Colorado, Utah and some other Western States expect to finish their exhibits this week.

In the Transportation Building the exhibits are more nearly completed than in any other department on the ground. During the week the French engines and cars were received and transferred to the tracks on which they will stand during the entire exposition, and the German pavilion, made at Berlin and brought here in sections, was put up. It is one of the most attractive in the building.

The first notable evidence of the fact that all the exhibits for the Mines and Mining Building have been received was noticed last week when workmen commenced to remove the railroad track. All the spaces are occupied with exhibits, but some of the pavilions are incomplete, and for that reason the goods remain unpacked.

The wine and fruit sections of the Horticultural Building show a vast improvement. Nearly every display in these two departments was installed last week.

The Wisconsin fish exhibit in the Fisheries Building was pushed forward and the exhibits will be installed this week.

Many of the State buildings have been thrown open to visitors. California is getting the various county exhibits in condition and the building is now an attractive place for visitors.

By the close of this week the fair will come out with flying colors.

Fighting the System of Awards.

The rebellion against the World's Fair system of awards is not confined to the commissioners of foreign countries. On Thursday last over 130 United States exhibitors in the Manufactures Building alone addressed to Director-General Davis a note which, it is expected, will be followed at an early day by the withdrawal of their exhibits from examination for awards.

This movement originated with John G. Low, president of the Low Art Tile Company of Chelsea, Mass., who have an extensive exhibit in the northwest corner of the building. He was speedily joined by S. D. K. North, secretary of the National Association of Wool Manufacturers and secretary also of the Special World's Fair Committee of Woolen Manufacturers of the United States, about 130 in number, who are exhibitors and who approve of his course. The other signers represent very important interests, whose exhibits are of the highest character as representations of skill and national technical progress. The matter has been well presented by Mr. North, who is quoted as follows:

"It may be that we are to blame for the misunderstanding, but the fact is that we came here with our exhibits for the express purpose of competing with other manufacturers and carrying off a prize for the best goods. The discovery that there is to be no competition, but only a medal and diploma for merit, without any hint at superiority or supremacy, disappoints and disgusts us. If we had known it we would never have sent an exhibit. It seems to me that Mr. Thatcher might just as well give us all a medal apiece now and let us go home; for anybody can get one, and it means nothing and is worth nothing.

"As the medals are no account it makes no difference in fact whether they are awarded fairly or unfairly, and yet, as a matter of principle, we object just as strenuously to the rules concerning awards. As I understand the rules there is to be a board of judges of about 500 members; these judges are to be divided into thirteen departmental committees; each committee is to subdivide its department among its individual members; each individual member is to award medals in the territory assigned him; and in case of injustice an appeal is to be, first to the departmental committee, then to the board of judges, and finally to the commission itself. Now, this is all bosh. In the first place no one man can be an expert in all the exhibits in his field. Suppose such an expert were assigned to woolens, we have 150 different lines, and no one man can be an expert in all of them. Supposing that he is a competent expert, still everything will depend on his integrity and his freedom from prejudice. If he does an exhibitor injustice the right of appeal is worthless. The exhibitors will not know what his decision is until the last moment. An appeal will involve a regular trial, with witnesses and some one to conduct it, and may consume months of time, and finally, if there should be many of these appeals, they could never be adjudicated in the world. The right of appeal, therefore, is worthless, and the system practically leaves every award to the judgment of one man.

"There is a comical side to this, too. I am told that there are 39,000 exhibitors and that Mr. Thacher has ordered 36,000 medals. It would seem from this that the poorest person and the poorest exhibitor will hardly be overlooked. But if any one is overlooked his complaint will be a very ludicrous one. He cannot complain that another exhibit was unfairly adjudged better than his; he can only appeal from the judgment of the expert that his exhibit had no merit worth noticing. All this is ridiculous."

Mr. Thacher makes the following explanation of the course of the Committee on Awards in adopting the system which is so much condemned:

"It is an American system and was adopted and used at the Centennial. Aside from the question of the merits of the two systems, the Congress of the United States has definitely decided that there can be no such thing as a competitive system, it having decreed by a legislative act which no foreign representative nor American exhibitor can very well change. It has decreed that there will be but one kind of medal and diploma, both being constructed under the direction of the Secretary of the Treasury. We could not, if we wished, now provide for gold, silver, or other kind of medals except the bronze. Therefore the competitive system, certainly as operated from graded awards, is impossible. This is not my system, but the American system, put into operation at Philadelphia, and forming the only precedent to which we have access. This system is going to stay, too. I do not say that in an offensive spirit, but I believe it is a good system capable of being operated satisfactorily to every one and to change it now would simply bring disaster upon the fair. The system, as it is, will not be changed and as far as the competitive system is concerned it could not be done. Section 3 of the act of Congress, approved March 3, provides that it shall not be a competitive system."

"Would not the system of awards, as it now is, result in the giving of medals to about every exhibitor at the fair?"

"Any exhibitor who has an excellent article will not be deprived of a medal."

Sunday Opening Wins.

By a vote of 29 to 28 the National Commission approved the rule adopted by the local directory providing for opening the fair on Sundays. This action was taken on May 23, very unexpectedly to those in favor of Sunday closing, who had been confidently counting on the commission arraying itself in opposition to the directory. The intervention of the United States having been appealed to, Attorney-General Olney has directed the local district attorney to make a test case in the United States Court for the district, and the question will be decided whether a portion of an act of Congress can be disregarded. The constitutionality of the provision will be an important phase in the legal fight.

Interesting Belgian Exhibits.

Nothing in the Belgian exhibit in Manufactures Building is more curious, interesting and beautiful than a group of bronzes placed near the main entrance. It comes from the foundry of the Société Anonyme at Brussels. The large pieces consist of a vase 8 feet high, a life-size statue of Leonidas at Thermopylæ, and a piece 5 feet high consisting of a beautiful female figure with three or four Cupids clambering over it called "Innocence Tormented by Love." The smaller pieces consist of wreaths of flowers of the most delicate and intricate molding imaginable.

The chief interest in these bronzes arises from the process by which they are made, called "the lost wax process," known to have been in use by the sculptors and foundries of antiquity, but long since and for many centuries lost and unknown. Of late years it has been, as is supposed, rediscovered, and is now in constant use at the foundry of the Société Anonyme. The process in

ordinary use, called the sand process, gives better results in some kinds of castings; but where delicate outlines and shapes are desired nothing is comparable to the lost wax process.

Molding in wax is the most delicate and exact molding that is known and enables the artist to preserve every vine and flower and filament of vegetation, and every pore of the skin in a statue of the human body. The wax process consists of making a negative mold in cement from the wax figure, and then removing the wax by the application of heat. On the same principle runners through which the melted bronze is to be poured into the negative and vents through which hot air and vapors of the wax are to escape are provided. When the statue has been cast the negative is broken away from it, and the bronze casting is so perfect and minute that the slightest touch of the artist's finger on the wax model reappears faithfully in the bronze.

The exhibit of H. Pieper of Liége, is a young arsenal of everything in the way of small firearms that will kill man or beast. There are rifles, muskets, shotguns and pistols, and every conceivable size and style of each. The strangest feature of all is the different styles of guns made for the trade in half-civilized countries like Africa and Arabia. The natives of these countries have their own ideas of what constitutes a handsome and effective weapon and will have no other kind. The African races prefer a smooth-bore gun about 3 feet long, with a yellow or green stock, looking like a toy gun, and Mr. Pieper, rather than lose their trade, gets up a fascinating line of these bright-hued arms. Then the Arabians must have a gun 7 feet long, with a black or bright red stock running the whole length of the barrel. In the exhibit is a large lot of shotguns that will excite the envy of every sportsman that inspects them. They have one, two or three barrels, as one may choose. Some of the two-barreled and three-barreled guns have one barrel rifled for a bullet and the other smooth for shot.

In connection with the shotguns there are exhibits that explain how the delicate tracery on these gun barrels is produced. Each gun barrel is made by wrapping a ribbon of metal around an iron rod and afterward welding its edges together. This ribbon is made of two, three or four small square rods, some of iron and some of steel, welded together. In some cases these small rods are twisted before welding, and twisted in different ways. When the gun barrel is made and polished it is then dipped in an acid, which eats the iron and steel unequally, and so produces all the wonderful tracery that is so much admired. This process is designed primarily, however, to produce greater strength, and the tracery is almost incidental.

The pistols in this collection are a particularly sad feature, as they are intended entirely for killing human beings, in time of peace, and are got up in such quantity and variety as show conclusively the widespread and growing popularity of this amusement.

The rope exhibit of F. Vermeire-Hellebout of Hamme is never passed unnoticed. Hung against the wall in perpendicular parallel lines are samples a few feet long of 50 sizes and kinds of rope, from a cord ¼ inch thick to a cable 6 inches in thickness and apparently as hard and inflexible as an oak tree. The admiration for the workmanship is increased by the fact that it is all entirely hand made.

One would suppose, from looking at it and feeling it, that the largest sample could never be twisted into its present form by anything less than the Allis quadruple expansion and condensing engine; and the statement that men have made such an article with their naked hands excites considerable astonishment. It is also claimed that hand-made ropes are double as strong as ropes made by machinery.

Mechanical Tests.

It is altogether probable that the series of mechanical tests contemplated in the report of the committee of the American Society of Mechanical Engineers to the Committee on Awards will be made. The question now before the World's Fair authorities is rather one of means and methods than of desirability. There is a disinclination on the parts of exposition officials to exact further fees from the exhibitors, yet rather than to let the great opportunity slip the exhibitors will be called upon. As to the importance of such a series of tests there is no difference of opinion. Exhibitors, engineers and World's Fair officials unite in saying that the tests should be made and made thoroughly by the most eminent experts.

Ten Thousand Mexicans Coming.

The St. Louis Spanish club is in receipt of advices from the Hathaway Excursion Company that they expect to bring in special excursions to the World's Fair over 10,000 Mexican visitors. Among them will be a large number of the leading merchants and professional and business men of Mexico. The first excursion will arrive at St. Louis about June 24, composed mainly of merchants of the city of Irapuato and vicinity. Governor Cosio of the State of Queretaro is expected to accompany this party.

Implement Exhibitors Organize.

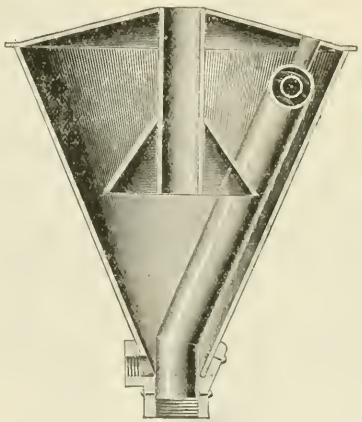
The agricultural implement exhibitors at the exposition met at the Grand Pacific Hotel last week and effected a permanent organization to advance their interests at the fair and to meet once a week for the exchange of ideas. The following officers were elected: President, H. C. Staver, Chicago; secretary, R. I. Ardrey, Chicago; treasurer, A. D. Frary, Chicago; vice-presidents, James E. Deering, Illinois; J. D. Oliver, South Bend, Ind.; James Manning, New York; F. E. Myers, Ohio; Charles E. Whitman, St. Louis; Stephen Bull, Milwaukee; P. S. McGowan, St. Paul; W. D. Mitchell, Chattanooga, Tenn.; Mr. Mann, Louisville, Ky. The question of entering into a competition for awards without a field trial of the implements, contemplated by the Committee on Awards, was deferred until a future meeting.

The Ferris Wheel.

The Ferris wheel is a sure enough wheel now. The great felloes were joined together on Friday last and the work of lighting up was begun. Twenty-five of the 36 cars which will be suspended from the wheel have already been completed, and they will be swung into position this week. The engine is in place and the contractors expect to see the wheel in operation on June 10.

Number of Visitors.

Comparisons daily made with attendance on corresponding days at the Centennial show that the number of visitors is steadily over 50 per cent. larger. Arrangements have now been made for great electrical displays on Tuesday, Thursday and Saturday evening of each week, which are expected to prove very popular and greatly increase the gate receipts.



The Eclipse Exhaust-Pipe Head.

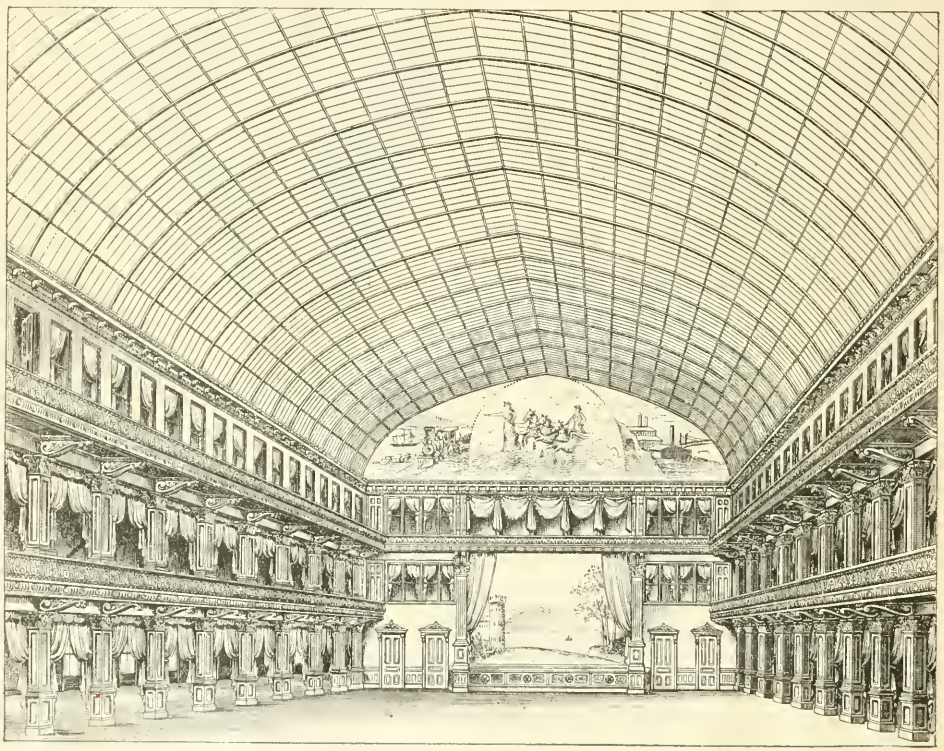
The Eclipse Exhaust-Pipe Head.

The New York Exhaust & Blow Pipe Company, Hartford, Conn., with New York office at 136 Liberty street, have been granted a patent on the Eclipse exhaust-pipe head, which they are placing on the market through dealers. As shown in the accompanying sectional view, the exhaust steam as it enters the head is carried near the top, then discharged horizontally around the head, giving it a centrifugal motion, and, it is said, driving all the solid matter to the outer wall, when it runs down and out of the drip. The light and dry steam escapes through the center of the top. In addition to the above centrifugal motion, for separating the heavy matter from the light, there is a small pipe running from the outside, and so connected that when the exhaust steam is going through the large pipe it causes a suction in the smaller one, thereby drawing cold air into the head, which, combined with the centrifugal motion, makes, it is claimed, a very efficient system of condensing the steam. We understand that the manufacturers are meeting with great success, and look forward to a large trade in this device.

ROOFING AND CORNICE.

A Large Glass Roof.

The New York Industrial Building (Grand Central Palace) occupies the entire block bounded by Lexington avenue, Depew place and Forty-third and Forty-fourth streets, adjoining the Grand Central Depot, New York City. It covers an area 200 x 275 feet, with a floor space of 310,000 square feet. A notable feature of this building is the glass arch over the auditorium, which has a clear span of 84 feet and is 155 feet in length. The illustrations presented herewith give some idea of the extent of this roof and the methods of its construction. Fig. 1 is an interior view of the auditorium, while Fig. 2 is a sectional view through the building, illustrating the method of supporting the glass roof, which embodies a peculiar adaptation of the Hayes system of iron and glass roof. It is at the same time an arched ceiling and roof of glass, supported by seven pin-connected steel trusses, each weighing 17 tons, which rest upon the walls above the glass work and are not seen from below. Another feature to which particular attention is directed is that no shadows are cast. From these trusses are suspended 6-inch steel ribs, transversely to which are 3-inch angle iron purlins. Upon purlins are secured the immediate bearings for the glass, which are the guttered bars and horizontal frame work, so arranged that they permit the collection and discharge of all vapor or moisture which may condense upon the under side of the glass. The arrangement involves an intricate application of the system, and embodies special features not before employed in glass-roof construction. The supporting trusses perform the dual function of sustaining the roof-ceiling, as described, and also of supporting the floor to the summer garden, which is to form one of the most attractive features of the building. The arrangement as embodied in this building was conceived by L. R. Mestaniz, a member of the Industrial Association. The structural iron work was carried out by Charles O. Brown, civil engineer of the Riverside Bridge & Iron Works, Paterson, N. J., and the superstructure of glass by George Hayes, New York City.



A Large Glass Roof.—Fig. 1.—Interior View of Auditorium.

Trouble With a Roof.

From H. B., *Prairie du Chien, Wis.*—I notice in *The Metal Worker* of May 13, a letter from J. M. S., Platteville, Wis., about trouble with a tin roof. No person should go on to a tin roof with leather boots or shoes on, but always with rubbers. In shoveling off snow a wooden shovel should be used. No ice should be chopped on it. The best recoated terne plate should be put on, coated by the palm oil process, as acid will cause the iron to rust. Then, if the roof is kept well painted, there need be no leaking.

FLASHINGS.

The Garry Iron & Steel Roofing Company of Cleveland, Ohio, have increased their capacity by adding a 150 horse-power engine and several other machines necessary to improve and expedite their work, as the rapid increase in business demands it.

J. Flanagan, 396 Fourth avenue, New York, is now engaged on the sheet-

metal work of the American Theater at Forty-second street and Eighth avenue, which is said to be one of the largest theaters in the United States. The roof will be of Spanish tile and copper. Some of the sheet-metal work for the front is of special design and is being erected with creditable skill. A piece of work to which Mr. Flanagan points with pride is the sheet-metal front on the office building at Thirty-fifth street and Fifth avenue. It is very elaborate and the entire work and making of all the ern Mineral Wool Company, Cleveland, Ohio. They advise us that they have a full stock on hand and are in a position to fill all orders entrusted to them with promptness. There is a growing demand for mineral wool, not only for insulating refrigerators and cold storage rooms but also for packing steam and water pipes, for deadening and packing walls and partitions, to make apartments warmer in winter and cooler in summer. On account of the large difference between the freight rates on car

important data that people are apt to forget, such as size of the collar, number of bank book, &c.

THE CANTON STEEL ROOFING COMPANY, Canton, Ohio, are established in their new plant which replaces the one destroyed by fire December 7 last. The main building is larger than the old one, giving them more facilities for their work. The entire establishment is not yet completed, but the office and buildings back of the main building are now

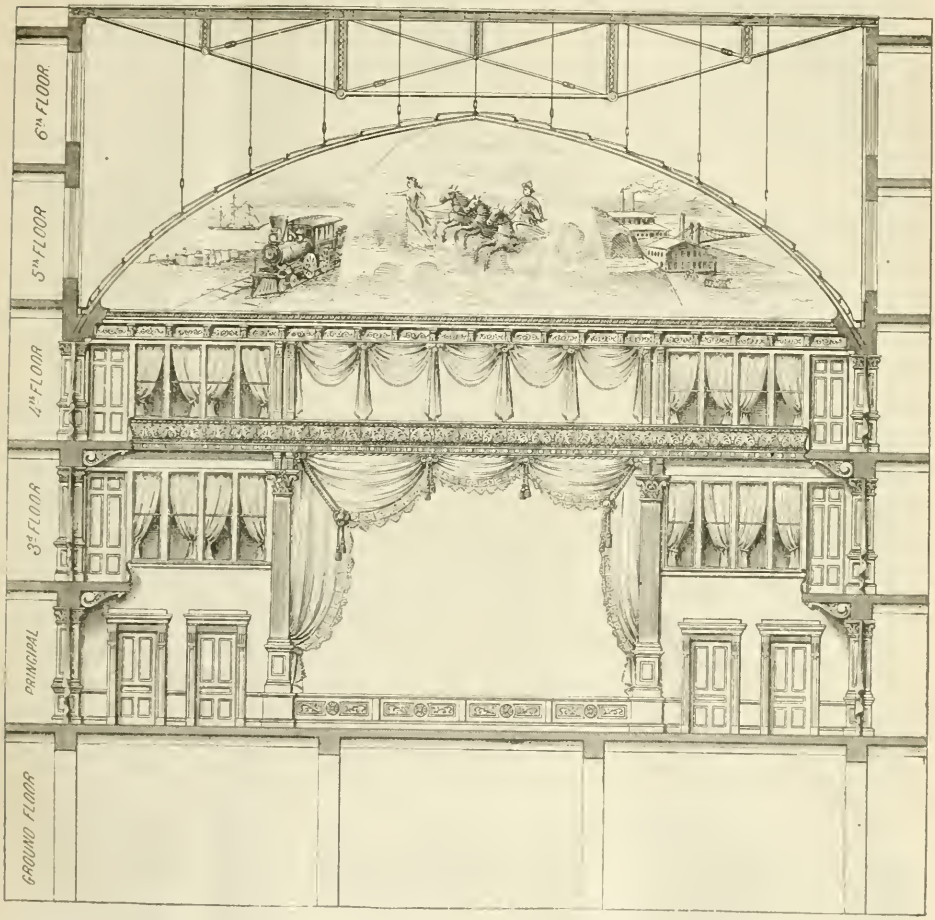


Fig. 2.—Sectional View through Building.

ornaments was done in his shop and by his men.

B. CONLAN & CO., 47 Lawrance street, Newark, N. J., make a specialty of fancy brass and sheet-metal ornaments of all kinds. The company occupy a four-story building, having the heavy presses and drop hammers in the basement, a machine shop on the first floor, where the office is also located, and on the upper floors are rows of foot presses and benches for stamping out and finishing ornaments and devices.

THE KANSAS CITY METAL ROOFING & CORRUGATING COMPANY, Kansas City, Mo., have been appointed agents for Kansas City and vicinity for the Westloads and less than carloads the Western Mineral Wool Company found it absolutely necessary to establish a depot for distribution at Kansas City, as the rates on small lots from Cleveland or Chicago are extremely unfavorable to the Western trade.

THE AMERICAN ROOFING COMPANY, St. Louis and Cincinnati, send out a little identification card. The card, which folds once, carries on the outside reference to the American Roofing Company and their manufactures of corrugated iron and other goods. Within are blanks for the name and address of the person to notify in case of accident to the bearer, and memoranda for various

under contract and there are other structures to be erected as soon as the present lease on a portion of the ground expires. The company have equipped their works with the latest and most improved machinery for manufacturing their line of sheet-metal goods, and are now filling all orders promptly. They report their trade for the first four months of the present year as greater than for the same period in any previous year.

Fifty Oregon merchants are in San Francisco to encourage coastwise trade and two more steamers will be put on between that city and Yaquina next autumn.

Lalance & Grosjean Mfg. Company's Works.

As the pioneers of seamless stamping and sheet-iron enameled ware manufacture in the United States, the Lalance & Grosjean Mfg. Company of Woodhaven, L. I., and Harrisburg, Pa., have a justly deserved reputation, while the fame of their agate ware extends far beyond the limits of the United States. It is probable that the familiar trade-mark of the firm, affixed to articles of their manufacture, is known in almost every corner of the globe. A story is even related, as strictly veracious, to the effect that one of the members of a recent polar expedition picked up an agate ware cup at nearly as high a latitude as has ever been reached by man; a relic, doubtless, of some former explorers in that icy region.

The following brief mention of the rise of this important industrial establishment will be of interest:

The firm of Lalance & Grosjean is one of over 40 years' standing. The present head of the concern was one of the original founders. He is Florian Grosjean, a native of Switzerland, who in early life emigrated to the United States. About the year 1850, he started in business in a small way with a compatriot, W. Lalance, as importers of sheet metal culinary vessels. These articles the partners shortly commenced to manufacture for themselves on a limited scale in the city of New York. Prospering in their undertaking, they moved, in 1863, to Woodhaven, Long Island, where they built a factory, employing from 75 to 100 hands. In 1869, the business having increased in size and importance, the firm was incorporated under its present title, and continued thriving until February, 1876, when the whole plant was destroyed by fire. The buildings were, however, quickly re erected, and on a much more extensive scale than before; so that in July of the same year, after a stoppage of but five months, the works were again in full operation. Since that period the history of the Lalance & Grosjean Mfg. Company has been one of unbroken progress and prosperity, until they stand to-day as the largest manufacturing concern of their class in the world.

Mr. Grosjean, who on the death of his partner became head and principal stockholder of the company, is still actively engaged in the business as president. He can look with natural pride upon the vast industry which he originated and has built up from the smallest kind of an enterprise to its present dimensions. President Grosjean is a notable example of the boundless possibilities which lie before every self-helpful and intelligent young man in this country. Starting in life as a poor boy, with absolutely no advantages to speak of, he has managed by enterprise and perseverance to place himself among the foremost and most honored captains of industry in the United States.

The Woodhaven Factory.

A brief sketch of the Woodhaven factory of the Lalance & Grosjean Mfg. Company and some facts in relation to the manufactures there carried on are appended. Considering the immensely increased use of enameled ironware for household purposes everywhere, it will be readily understood how large a business is done by the company in this line of goods alone, not to speak of the extensive list of household utensils in bright and japanned tinware, in plain iron and steel and other material, which are also produced at the factory. It is said to run into millions of dollars annually. Consequently the visitor to Woodhaven will expect to find a very large establishment. And he will not be disappointed. The great pile of red brick buildings, with high clock tower and chimney, which constitute the factory, are a very noticeable feature on the line of the Long Island Railroad. Woodhaven Junction, near which they are situated, is less than half an hour's run from the Brooklyn terminus of the road, and is very easy of access. The circumstance of the railway running under the walls of the establishment furnishes it with the best of shipping facilities. The buildings cover three-fourths of the company's ground, or three whole blocks. A fourth square is still available for future extensions, being at present occupied by workmen's dwellings and some large oil tanks, which will be presently referred to.

By a reference to the ground plan presented with this article the disposition of the buildings, yards, &c., will be plainly seen. The whole plant covers some 16 acres, and is upward of ¼ mile in circumference. The main block, situated to the east, which is almost wholly covered by buildings, measures 500 feet square. On three sides, as will be noticed on the plan, it is surrounded by an unbroken line of shops and warehouses. These run to three and four stories in hight, some parts having a basement in addition.

Stamping Department.

The whole ground floor of the outer buildings fronting the north, parallel to the line of railroad, as well as of those on the east side to the middle of the block, is occupied by machinery for pressing and stamping sheet steel and iron goods, except at the northwest corner, where is situated the machine shop. The presses used for the purpose, some of which are the most powerful tools of their class ever made, were mostly designed and manufactured on the spot. Thirty-five machinists and a corps of draftsmen are constantly employed on this work, which is a very important item in the economy of the establishment. The stock of tools of various kinds in hand is valued, we are told, at over $750,000. A special fire-proof storehouse is provided for the more expensive ones.

In the stamping shops rows of presses and stamping machines are lined on each side. Here the sheet iron and steel are cut out and stamped into culinary vessels and the various articles of household use manufactured in the factory. The majority of these are passed on to the enameling shops to be turned into agate or other enameled ware. The largest presses used are capable of forming articles up to 3 feet in depth and 4 feet in diameter, exerting the enormous pressure of 4000 tons. These machines are said to do the largest work in seamless stamping that can be accomplished by any concern in the world. The metal sheets used for this purpose are anywhere from No. 7 to No. 27 gauge, according to the use to be made of the objects and the strength required. Bathtubs, for example, which are probably the largest articles stamped out of one sheet, are often formed of comparatively thin metal, and, provided the subsequent annealing is carefully done, are said to be perfectly strong and efficient, notwithstanding their tenuity. Strong kettles for special uses and other large articles require, of course, the heavier gauges of sheet metal. Boiler heads take the thickest metal used in the factory.

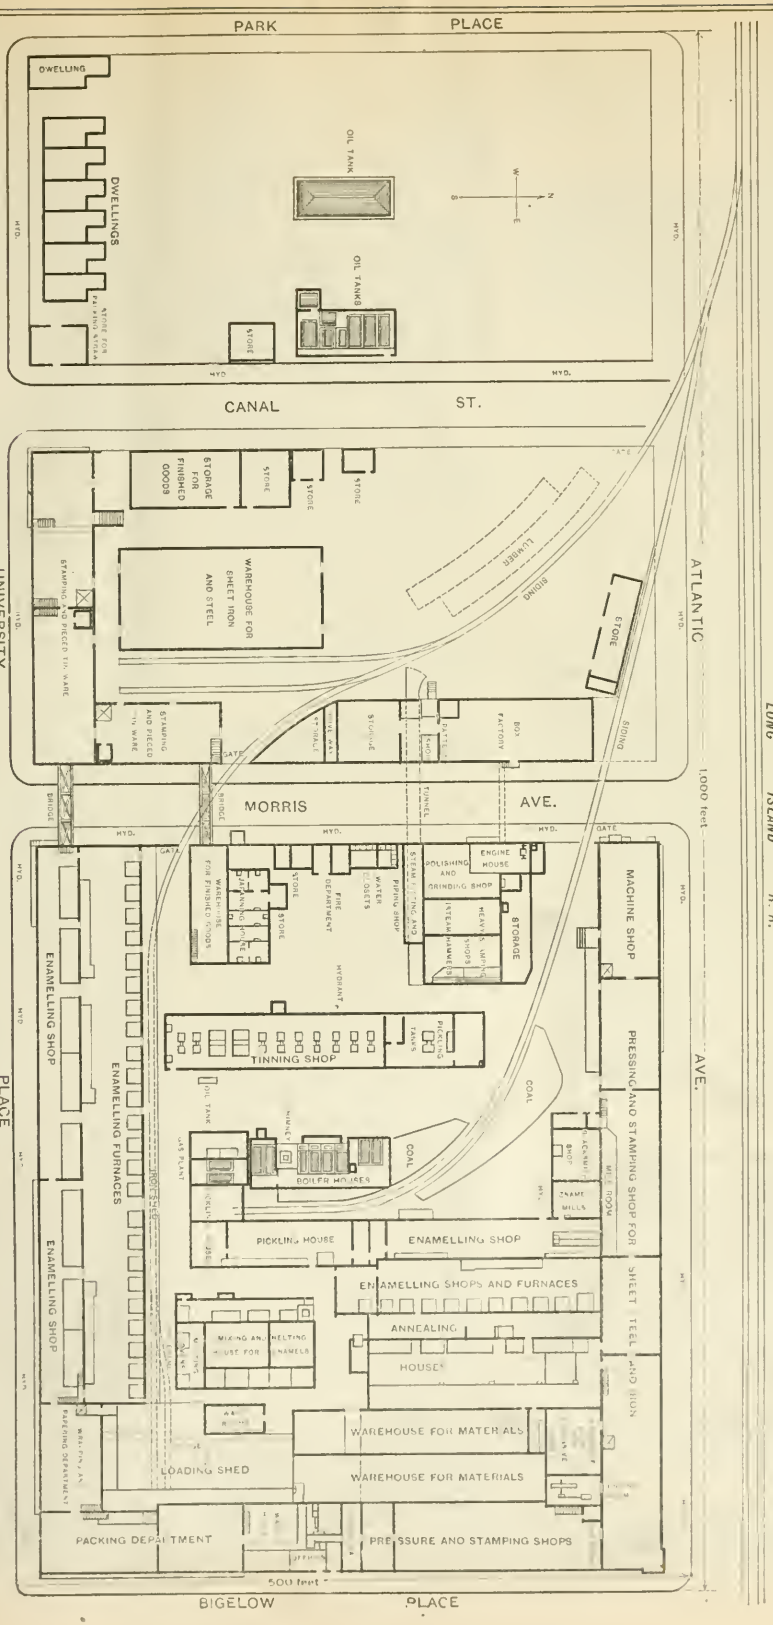
Spinning lathes are placed in the second story of the north front, the third floor being used for tin work. A great part of the soldering work of the establishment is carried out on this floor, the soldering stoves being heated by gas.

Immediately above the stamping shops on the northeast face are the power presses for the smaller goods. As an instance of the volume of work compassed by one of these tools, it may be mentioned that a single stamping press seen here was turning out cheap teaspoons at the rate of 21,000 daily, the spoons flying out from the press almost faster than the eye could follow them. The attendance of one boy was all that was required for handling the articles and operating the machine. After witnessing this operation, one could more readily understand how it is possible to put such goods on the market at the seemingly ridiculous price of 60 cents a gross. The third floor of this portion of the establishment is occupied by japanning ovens devoted exclusively to the preparation of the larger sizes of tea trays, of which great quantities and varieties are turned out.

Enameling Department.

The extensive line of enameled goods manufactured by the Lalance & Grosjean Mfg. Company forms, however, the main feature of their business; and the space allotted to this department is naturally large. The whole of the southern portion of the main block is occupied by shops where only agate ware is treated. This well-known ware is made of sheet iron, which is found to take the enamel coating better than steel. The process of coating is not a complicated one, and may be briefly described as follows: The enamel preparation, which is a kind of glass mixture, the actual component parts being of course, more or less of a secret, is mixed and melted in large vats and ovens placed in the center of the block. When ready for use, the composition is transferred to a series of baths located in the south wing, where a number of women and boys are employed in dipping the article to be enameled. It should be mentioned that each article requiring coating is previously pickled and then scrubbed and thoroughly cleansed in order to remove all impurities which would prevent the enamel adhering to the metal. The article, after receiving its first coat of enamel preparation, is transferred to one of a long range of ovens placed parallel to the dipping troughs. Here it is fired for about seven minutes; after cooling it is redipped, and again fired —the process being repeated until the object receives its last coating. This is of a different kind and imparts the necessary gloss and hardness to the enamel coating. The quality of the ware depends entirely upon the number of coats it thus receives.

The enamel used for the last coat on agate ware is said to be the only preparation of its nature yet discovered which is capable of withstanding the action of acids. Sulphuric acid has absolutely no effect upon its surface. For this reason the firm have developed quite a large business in special pans and vessels for chemists' use. They are cheaper, stronger, and more lasting than those formerly used for this purpose.



PLAN OF WORKS OF THE LALANCE & GROSJEAN MANUFACTURING COMPANY, WOODHAVEN, L. I.

Agate ware pans, too, are now largely used by photographers for their work, being more economical and effective than the more expensive receptacles heretofore made use of, besides being easily kept clean. In fact, we are told that agate ware is constantly finding fresh uses.

Besides this specialty, other ware in blue, white, pearl and mottled enamel is turned out in large quantities. Shops for operating these lines of goods are situated in another part of the block at right angles to the north front, and adjoining the annealing furnaces. More dipping troughs and ovens are placed in them, the process of enameling being essentially similar to that above described.

Oil Fuel.

Fifty-four furnaces are in use for firing enameled goods, besides which 20 large annealing furnaces, standing in juxtaposition to the stamping and pressing shops, are kept in full blast for treating the stamped iron vessels. These, and all furnaces on the works, are heated by oil fuel, which has been found to give here the best and most economical results. Crude oil, the material used, is consumed to the amount of about 9000 gallons daily. The oil is kept in large storage tanks, marked on the plan in the as yet unbuilt on square to the west. These tanks have an aggregate capacity of 160,000 gallons. The oil is conveyed into them by natural flow through pipes connected with stand pipes adjoining the railroad track, the material being delivered direct from the tank cars. From these reservoirs the oil is pumped to the various portions of the works as required. The system of firing used is that of the Aërated Fuel Company of Springfield, Mass., who erected the oil plant. The saving of time and labor and the gain in cleanliness involved in the adoption of oil fuel is said to be immense. The dirt and ashes attending the use of coal are entirely avoided, and the fires can be instantly lighted or extinguished. The second floor of the south wing is used for the manufacture of wash boilers in tin and copper, of which a very extensive line is made. The wash-boiler shop is one of the finest of its kind, being more than 300 feet in length. All the various processes of piecing and finishing the utensils are carried on here —soldering, riveting, &c. This shop is connected, by means of a bridge over the intervening street, with the second floor of the new tinware department in the center block.

Tinning Shop and Boiler House.

A large proportion of the tinware made at the factory is retinned after manufacture, particularly that which has been at all heavily stamped. For this purpose a large tinhouse is provided. It is located almost in the center of the eastern block, as will be seen by reference to the plan. The tinhouse contains 40 pots, holding in the aggregate about 150,000 pounds of melted tin. These pots are kept constantly at melting heat, year in and year out, the material being never permitted to solidify.

Parallel to the tinning shop are the boiler houses, containing a battery of eight tubular boilers of 100 horse-power each, made by Smith Brothers of Brooklyn. Next to the boiler house, and between it and the gas plant, rises a brick chimney 157½ feet high, which serves to carry off all the smoke and vapors of the factory. Every fire in the entire establishment is connected with this central chimney by means of a spider-web-like ramification of underground flues leading from all parts of the establishment. Power is supplied by two horizontal engines. One Corliss engine of 500 horse-power is placed near the northeast corner of the main block, and one of 250 horse-power, made by the Fitchburg Machine Company of Fitchburg, Mass., is located near the northwestern corner. The latter supplies the power for the new buildings on the second block.

Adjoining the second engine house is the polishing and grinding shop, containing a large number of emery and corundum wheels. Next to this department are the shops containing the steam hammers, mounted on a foundation 35 feet deep. These hammers are very powerful and are capable of striking a blow of 2 tons.

In addition to the departments we have briefly mentioned, a large number of others are housed in the numerous buildings which cover the main block. Exigencies of space, however, forbid further enlargement in this direction. One can only name the japanning houses, the blacksmith's shop, the departments for making ears, bails and handles of vessels, the mills for grinding enamel, and other places where are conducted the hundred and one minor processes incidental to a great factory. Specially designed machinery is employed for the carrying out of almost every detail connected with the various manufactures, a great part of which really deserve a detailed description, which it is impossible to afford at present.

Reference should not be omitted to the great castellated clock tower standing at the northeast angle of the square, which is a very prominent feature of the works.

The Tinware Factory.

Passing from the northern quadrangle, which is nearly covered by houses, we come to the second square on the western side, where is situated the newest portion of the factory buildings. This part of the works is connected with the main buildings by means of two bridges on the second floor, and a subterranean tunnel. The L-shaped building, 300 x 40 feet, which stands in this portion, was erected only last year. It is four stories in hight, brick built, and in general features similar to the outer buildings of the northern square. Here is conducted the bulk of the tin and japanned ware manufacture. Some of this class of goods are, as will have been noticed, still made in the older portion of the works, but it is intended to eventually transfer the whole of the tin work to this side, leaving the main buildings exclusively for the operations connected with enameled goods, the growing demand for which calls for largely increased space. All kinds of domestic tinware, stamped and pieced, plain and decorated, are turned out in the numerous shops of the building. Machines of special design for seaming, wiring, bending, flanging and otherwise operating the various articles of tinware manufactured enable the sundry operations to be carried out with the greatest quickness and economy of labor. Indeed, the actual hand labor put into the work all over the factory appears to be reduced to the finest minimum. Machinery accomplishes almost all the mechanical operations in which the intervention of the human hand was formerly considered essential, and does it with far more accuracy and celerity. A great deal of the soldering here is done by women and girls.

Some very handsome decorating is conducted in a portion of the new building, on such articles as may be appropriately embellished—namely, tea and coffee pots, tea trays, water coolers and other enameled or japanned goods. A department of considerable size is tenanted by the company's designers and decorators. The outline designs are usually laid upon the object to be decorated, the color being subsequently applied by hand. Some of the japanned articles, as tea and crumb trays, coolers, &c., are decorated with ornamentation in gold and colors, which is placed on the article from transfer paper, on which the patterns have been stamped by means of chromo-lithography. The lithography is also carried out on the spot.

Warehouses and Stores.

Adjoining the tinware factory is a large building containing the raw material in sheet iron and steel. About 50 tons of this material are used weekly. The whole of the supply is furnished by the company's new rolling mills at Harrisburg, Pa., which were first put into operation about three months ago, and of which a detailed description was published in a recent issue. The amount of tin plate used in the manufacture of tinware reaches a weekly average of nearly 1000 boxes. It is likely that a department for the manufacture of tin plates will before long be added to the firm's Harrisburg mill, in order that they may supply themselves with this important item. This course has already been taken with great success by a large stamping company of St. Louis.

Several other storea for material, and also for finished goods, are located on the second block. The principal warehouses are, however, placed in the southeast angle of the main block. The ground floor of this section is used for office purposes and for wrapping, papering and packing goods. These goods are then either stored in the large warehouses on the floors above, or are, when boxed and required for shipment, transferred to the adjacent loading shed. A very large stock of goods is carried by the firm not only here, but also in their New York, Boston and Chicago stores.

The facilities for shipment are excellent, and can be readily seen on the accompanying plan. The sidings from the line of the Long Island Railroad traverse the works in a number of directions. Several tracks are arranged for delivering the raw material alongside the various stores. The line which communicates with loading shed divides into a double track, and is so arranged that the cars for the East are always loaded at one side of the shed, and those for the West on the other side. About four carloads of goods are sent away on an average daily, besides some 500 cases for the New York trade, which are dispatched separately.

For the packing of these goods about 2,000,000 feet of lumber is cut up yearly, the packing cases—for which no charge is made—costing the company in material and labor some $50,000 annually. The lumber store and box factory are located on the middle block, as shown in the plan.

Precautions Against Fire.

It is stated that the insurance companies regard the Lalance & Grosgean factory as one of the very best risks they have, owing to the excellent fire arrangements provided. There is a regular fire brigade composed of 50 employees, who are said to be a most efficient corps. Every precaution has

been taken in the buildings to make them as nearly fire proof as possible. The roofs are all of metal with galvanized iron cornices. All the wood work of the interior is lined with metal, and sliding iron doors divide the various shops. A supply of buckets, with vertical pipes and hose, are placed in each building, while 25 hydrants are located inside and outside the yards. These are all connected with two reservoirs of 4,000,000 gallons capacity, situated on an elevation at about three quarters of a mile from the factory. The pumping capacity is about 1,000,000 gallons daily, the water being obtained from artesian wells. These reservoirs constitute also the chief water supply of the town of Woodhaven. Every precaution has been taken to avoid the risk of a similar disaster to that of 1876, and, so far as human foresight can go, the preventive measures adopted almost entirely preclude any recurrence of such an unfortunate event. The buildings are heated partly by steam and partly by stoves.

Organization and General Arrangements.

A feature of this great industrial establishment which is well deserving of lengthened description, but to which we can afford but a passing reference, is the efficient system of organization which pervades the entire factory. Although some 1700 hands—men, women, boys and girls—are employed, all seem to know exactly what their work is and appear to do it thoroughly. There is no crowding and no hurry. There are, it appears, about 40 different departments, each one of which is in charge of a foreman, to whom is relegated the entire control of the workers in that department, and who is directly responsible to the general superintendent, E. W. Ball, for the work of his branch. Several of these departments are again sub-divided into sections controlled by leading men who are responsible to the foreman in charge. The system, which is of the nature of that in a large regiment, is stated to operate with clock-work regularity; but it must have required a vast amount of organizing skill to bring it to perfection. The space allotted to each worker is very generous, and one of the most striking points in the whole establishment is the amount of elbow room possessed by all. The arrangements for supply of light and air are excellent, and the general health of the workers is consequently said to be exceptionally good.

The firm exercise a wise liberality toward their employees, and in many ways evince a concern for their well-being and comfort which is apparently fully appreciated on their part. Strikes are unknown, and we are told that some hundreds of the men now working for the firm have been continually in their employ for the last 10 to 25 years. Most of them have grown up in the concern and take the greatest personal pride in its success and progress. The surroundings of the factory are very attractive. A park has been laid out immediately adjoining it, where green sward, flowers and trees, and benches for rest, are provided for the pleasure and refreshment of the workers and their families. From all reports there is a remarkable contact or personal interest and sympathy between employers and employed, which fully accounts for much of the success of the concern, and which can but make for good and cheerful work on the part of their employees.

The presidency of the Lalance & Grosjean Mfg. Company is held, as we have mentioned, by the venerable founder, Florian Grosjean. Mr. Grosjean is ably assisted by the vice-president, Augustus J. Cordier, to whose energy and judgment much of the later success of the concern is due. E. W. Martin is secretary and treasurer, and E. W. Ball has charge of the factory.

Besides the immense domestic business done by the company, they have a very large foreign connection. Their principal markets abroad are found in Canada, Australia and Brazil, although they are doing a good trade in South Africa, China, Japan, India and other quarters. This foreign business is yearly increasing. The main office of the Lalance & Grosjean Mfg. Company is at 19 Cliff street, New York City.

Prize Competitions

$25.00.

Prize Competition No. 26.

SUBJECT:

To What Extent Are Manufacturers and Jobbers Justified in Selling to Consumers.

This competition is suggested by the fact that frequent complaints are made that manufacturers and jobbers interfere with the retailer's business by selling to his customers. It is intended to draw out the views of the trade on the subject. In discussing the question the following points may, perhaps, naturally be touched upon:

The annoyance and injury to which the retailer is thus subjected:

What the rights and privileges of the manufacturers and jobbers are in this matter;

What it is feasible for retailers to do for their own protection.

This competition will remain open until July 1, 1893.

Those intending to compete are reminded that it will not be necessary to write long essays, but that comparatively brief and business-like answers will be favorably regarded as meeting the purpose for which these competitions are announced.

The following prizes will be awarded:

First prize	$12.50
Second prize	7.50
Third prize	5.00

The prizes will be awarded for answers which, in the judgment of the Committee of Award, are most suitable for publication and of the most general interest

We reserve the privilege of extending the time on any competition in case the contributions received are not of sufficient number or merit for the committee to award prizes. These competitions are open to every one, and it is hoped that there will be a general response from business men. We shall have the privilege of publishing any or all of the contributions received.

Replies are to be received not later than July 1, 1893. They should be addressed as follows:

DAVID WILLIAMS,
96-102 Reade street,
New York.
Prize Competition No. 26.

The committee to whom the contributions in Prize Competition No. 11 were referred have awarded the prizes as follows:

First Prize of $50 to J. E. JANSSEN, Eureka, Cal.

Second Prize of $25 to H. P. COLE, Council Bluffs, Iowa.

Third Prize of $15 to J. C. MOORE, Saltsburg, Pa.

Fourth Prize of $10 to HARRY G. DRUMMOND, Newark, N. J.

We also take pleasure in announcing the decision in Competition No. 12 as follows:

First Prize of $12.50 to J. E. JANSSEN, Eureka, Cal.

Second prize of $7.50 to A. Q. CASSELBERRY, Pittsburgh, Pa.

Third Prize of $5 to CHAS. F. BUGG, Farmville, Va.

Other Competitions which have closed are now in the hands of the Committees of Award, who are giving careful attention to the claims of the different contributions. From the number of these and the evident merit of not a few of them, we are assured that a great deal of valuable information and suggestion will be put at the disposal of the trade.

The Weekly Prize Competitions noted below are now before our readers and remain open until the dates named:

No. 24. Closing June 3.
Short Methods of Figuring Discounts.

No. 20. (Reopened.) Closing June 10.
A Reliable System for Securing the Correct Charging of All Goods Sold on Credit.

No. 25. Closing June 24.
Show-Window Display.

No. 26. Closing July 1.
To What Extent Are Manufacturers and Jobbers Justified in Selling to Consumers.

Another subject will be announced in our next issue.

As foreseen, the issues of silver certificates are steadily forcing out of circulation other forms of currency, and are now in such excess and are returned to the Treasury with such regularity that their issue is practically suspended. Custom House receipts to the extent of 40 per cent. are of this description, whereas before the passage of the Sherman law from 75 to 95 per cent. were gold certificates, which at the present time are withheld altogether. So marked has become the tendency to unload silver certificates upon the Government, while hoarding better forms of money, that packages of large certificates have been sent back unbroken within a week or ten days in payment for customs dues by banks which received them in the West.

It is officially reported from the computations by naval engineers that the cruiser "New York" on her trial trip made 21 knots, allowing for tidal currents.

STEAM AND HOT WATER.

The Heating and Ventilation of Halls and Theaters by the Blower System.

BY WALTER B SNOW.

In the hall or theater we seek that instruction, recreation or amusement which should drive from our minds all the cares of the hour, and, like a holiday, leave us rested and refreshed. But how many go away from a theater feeling rested? Is there not instead too much of a feeling of weariness, with perhaps a dull headache? The reason is not far to seek.

THE NECESSITY OF VENTILATION.

We have been for perhaps three hours in a room, large enough it may be, but filled to overflowing with human beings each vitiating beyond healthful use not less than 30 cubic feet of air per minute. Possibly, although we may hope not in these days of electric lights, this theater is illuminated by a mulitude of gas jets, each doing the work of five to six ordinary men in vitiating the atmosphere.

In a theater containing 1000 persons there will thus be rendered useless by human agencies alone—leaving the gas out of account—30,000 cubic feet of air per minute. We may realize how great is this volume when we see that, traveling at a velocity of 500 feet per minute, it would require a conduit of 60 square feet cross sectional area. How many of us imagine that, without extraordinary preparations in the original design of the building and its system of heating and ventilation, any approach to such an amount of air is supplied in the average theater of this seating capacity.

Perhaps, indeed, some attempt has been made toward this end; the ingenious architect and the economical owner have decided on ceiling ventilation, or possibly ventilation through wall flues, but while the opportunity for escape of air has been provided no adequate provision has been made for its admission, and consequently the entire system has been rendered nugatory.

With all the luxury of the modern theater, its upholstered and adjusted seats, its beautiful adornment, its agreeable and hygienically perfect incandescent light, it does seem that there must have been a sudden lapse in the usual business sagacity of proprietor or manager when, to offset all these inducements to the theater goer, he allows the air to become so overheated and polluted as to be almost unbearable.

CARBONIC ACID GAS IN THE ATMOSPHERE

Pure outdoor air contains about 4 parts in 10,000 of carbonic acid gas; good ventilation is considered to exist when the amount does not exceed 6 to 8 parts in 10,000. Tests in many of the finest theaters of this country and Europe have, however, shown carbonic acid present in a proportion mounting up to 40 and 50 parts in 10,000, while, except in the most modern theaters, it is doubtful if, as a whole, the proportion will average below 20 parts in 10,000 at the middle or toward the end of a performance.

The manager expects that all his other efforts toward ornamentation and comfort will be repaid in patronage. Why should he not introduce an adequate system and then advertise his as the best ventilated theater in the city, and make a strong point? This scheme is, in fact, being followed up by some managers who have introduced successful mechanical ventilating systems, and there can be no doubt that, other things being equal, the public will resort to the best ventilated theater. If the manager can only be made to look at his system as a financial investment, and can see wherein it pays, it will not take long for him to make a forceful move in the right direction.

DIFFICULTY IN HEATING AND VENTILATING A THEATER.

Many circumstances militate against the successful heating and ventilation of a large auditorium. Most important of all is the fact that it is not permanent in its confines. At one time it is almost one with the stage; at another (between acts) many doors are opened into the corridors; at other times there exist various combinations of the three. The room is extremely high, it has no outside wall exposure; the occupants are located in different strata, and owing to the levity of heated air these strata have naturally different temperatures which must be counteracted; the large number of occupants remaining for several hours require an enormous air supply, and the dimensions of the auditorium are such as to usually make it impossible to successfully heat and ventilate from openings in the walls. There is a science in planning a system under these circumstances, and there is a science in operating it that should place the successful operator on the roll of honor with the gas engineer, the stage carpenter and his compeers.

Systems now in successful operation prove conclusively that theaters can be effectually ventilated, and prove with just as much certainty that natural means are inadequate and mechanical means must be employed to secure the proper air movement. Such successful results are, however, not obtained without the most exhaustive consideration of the entire problem as it presents itself in the case of each individual building.

THE HEATING AND VENTILATING ENGINEER.

Coincident with the selection of an architect should be the choice of a thoroughly competent heating and ventilating engineer, who should, throughout the entire time of construction, work jointly with the architect. In no other type of building does the work of the engineer so interweave itself with that of the architect. With unity of purpose many an important feature of the ventilating system may be treated in such a manner, from an architectural and artistic standpoint, as to make it appear but a beautiful piece of ornamentation on a much-needed column or beam. How fully these professions are thus united will be evidenced by some of the descriptions to follow.

The first work of the engineer is to decide upon the system to be introduced. As in all other blower system work, there is possible either arrangements for vacuum or plenum vent or a combination of the two.

It is extremely difficult to secure success with the vacuum system alone, for some mechanical means is required to properly distribute the air as it enters.

PLENUM SYSTEM.

With the plenum system the fan is usually placed in the basement and is frequently of special form, other than the cased fan. A type of "cone" fan employed for this purpose is illustrated in Fig. 1. This fan, standing in a comparatively large apartment, draws the air from the adjacent apartments through the inlet and discharges it all around its circumference into the plenum chamber in which it stands. The air, preferably taken by means of a vertical shaft from above the roof, is heated by coils of steam pipe either before or after passing through the fan; generally dependent on available space; and from the plenum chamber is forced at low velocity through large ducts to its desired destination.

In a small theater in which a simple system is desired, the fan may readily be of the cased type and the air may be conveyed at reasonably high velocity to the bases of vertical flues, from which, at proper hight above the various floor levels, the air may be discharged toward the center of the room. Ventilation must then, almost of necessity, take place through wall registers and flues, the register openings being at floor level.

Such an arrangement is, however, entirely inadequate to the requirements of a large auditorium. Here the most careful attention must be given to distribution, no volume of air moving more rapidly than 2 feet per second must be allowed to come in contact with the person of any occupant, and yet, so far as possible, each occupant must have individual ventilation. To this end, the usual custom has been to so arrange the system that the movement of all air, accelerated by the heating action of the body, shall be upward, and that each individual volume of air shall traverse the person of only a single occupant. In reality, the dispersion of gases in the atmosphere is so rapid that these imaginary volumes readily assimilate. Various devices have been applied for the purpose, but with all there is necessary a complete distribution over the entire floor area. The simplest of devices consists in forming of the basement beneath the auditorium a clean and tight air chamber, into which the air is forced at low velocity, or throughout which it is distributed by a system of pipes designed to give to the air as little movement as possible within this space, the idea being that the entire space shall contain air under slight pressure. It then naturally tends to escape at uniform velocity through all outlets. If, now, the rising floor has been constructed as shown in Fig. 2, with each riser left

clear of the tread beneath it by such a distance as will allow the requisite volume of air to enter without exceeding a velocity of 2 feet per second, there will ascend along each person an equal volume of pure and fresh air, which, having done its duty of removing, by absorption, the exhalations of the person, will rise and pass out through properly located apertures in the ceiling. The balconies and galleries are more difficult to arrange, particularly as their occupants will be subjected to the inconvenience of having somewhat mixed with their own supply a portion of the vitiated air from the more favored ones below, for this foul air is bound to disperse to a greater or less extent.

Although the arrangement just described is the simplest of all for general distribution, yet many other schemes have been adopted for this purpose. For instance, the intersection of each riser and tread may be constructed as indicated in Fig. 3, the corner being formed by a heavy sheet-iron guard so generously perforated as to allow the air to escape in an infinite number of fine jets at low velocity, and thence to pass directly upward around the occupant of the chair above. The admission from the plenum space below to that immediately beneath the chair is clearly shown.

As an additional supply for the balcony, the scheme shown in Fig. 4 has been adopted, in which case the ventilation is backward toward the wall and ceiling, passing over the occupants of the balcony.

Still another device consists in supporting the chair upon a single hollow central stand, which being perforated along its vertical sides and receiving a supply of air from the plenum space beneath, readily distributes it beneath the occupant of the seat.

With ceiling ventilation there must always be means of adjustment, either by the closing of louvered openings in the ventilator top or by the movement of a massive candle snuffer (in form) shutting down over the central ventilator shaft from the auditorium. Of course, where gas is employed as an illuminant the vent openings should be placed immediately above the chandeliers, to thereby obtain the effect of the movement of the volume of air heated by the jets.

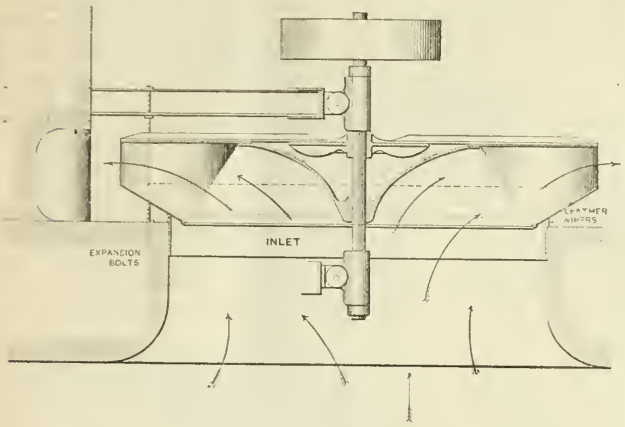


Fig. 1.—Special Cone Exhaust Fan.

Fig. 2.—Admission at Bottom of Riser.

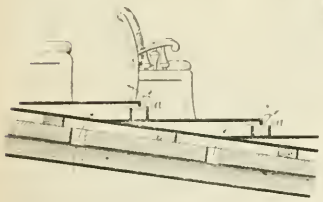

Fig. 3.—Admission Beneath Chairs.

Fig. 4.—Admission Along Balcony Rail.

THE HEATING AND VENTILATION OF HALLS AND THEATERS BY THE BLOWER SYSTEM.

PLENUM AND VACUUM COMBINED.

As the necessity of theater ventilation becomes better appreciated, the owners are ready to expend larger sums upon the introduction of the system. As a result, some of the later structures have been provided with more than one fan and a unique arrangement adopted.

While upward ventilation utilizes the heating effect of the body, yet it must be evident that the upper portion of a room must necessarily be overheated thereby, and, further, that the balconies and galleries must, to a certain extent have their air contaminated by that from below.

To avoid this, the system has been reversed, and the air supplied through properly located openings in the ceiling, sometimes reinforced by openings along walls and balcony rails. To make its downward action positive an exhaust fan or fans must be used, and the air exhausted at the floor beneath the seats in a manner similar, but opposite, to that employed in the previous schemes If the building is structurally strong enough the entire heating apparatus can be placed at the top of the building, taking its air from above the roof, without the medium of a supply duct. The exhaust fan, in turn, can be placed in the basement, whence its polluted air is discharged above the top of the building, but at the most distant point from the supply. When an exhaust fan is employed, its capacity should always be less than that of the supply fan, in order to maintain a pressure within the room or building ventilated.

OPERATION OF SYSTEM.

Although the heating of a theater may appear simple enough with a perfect apparatus, yet there is required of the engineer a clear conception of the existing conditions Radiation plays a great part in the warming of the occupants of a room. While air is a nearly perfect non-conductor of heat, yet radiation takes place through it readily. As evidence, we may enter a room having a temperature of 70°, with walls at 50°, and feel chilled, simply because heat is rapidly radiated from the body through the air to the colder walls.

It is, therefore, desirable in warming a theater to keep the temperature at about 78° to 80° during the day, the walls and all objects being thoroughly warmed somewhat above the temperature to be maintained when the building is occupied, so as to prevent at that time the radiation of heat from the bodies of those present to the walls or surrounding objects. Then in the evening, when the building is to be occupied, the temperature of air admitted may be dropped to about 70° and a large volume supplied to the house.

The arrangement of the blower system permits of the moistening of the air to any desired degree, and during the heated months of summer makes possible a very agreeable cooling of the air by means of ice. This may be exposed to the air currents at or near the fan in such a manner as to produce the most rapid melting. On a basis of supplying 2000 cubic feet of air per person per hour there would be required to cool this volume of air from 80° to 70° about 2 pounds of ice per hour. On the basis of a three hours' performance and 1500 occupants the total expenditure for ice would be in the vicinity of $25 to $40 (according to prevailing prices), not a very large amount for the manager who is shrewd enough to spend it, for he certainly can get his return in increased attendance, if people can actually be cooler indoors than out

The Ware Automatic Heat Generator & Regulator Company of Philadelphia and Chicago have arranged with a house in Worcester, Mass., for the manufacture of their hot-water heater, using gas for fuel. An order was recently placed in New York

for ten, and three are being installed at Camden, N. J., one for Charles Watson of the gas company. E. C. Ware is now in Boston attending to the interests of the company.

HEATING NOTES.

DIRIGO HEATERS for steam and hot water are being put on the market this season with a number of improvements, including cast-iron casings, instead of galvanized as heretofore. Particular attention has been given to circulation, which is positive, and a number of minor changes have been made, all in the direction of improvement. To meet a growing demand the Dirigo Heater Company have erected a new machine shop 105 x 28 feet, two stories high, on Cross street, Portland, Maine. The Boston office of this concern is at 51 Oliver street, and is in charge of W. J. Buxton, treasurer.

HART & CROUSE, Utica, N. Y., issue a neat illustrated catalogue and price-list of the Royal steam and hot-water heaters of their manufacture. The pamphlet is bound in colored covers, with the name of the firm embossed in silver letters. Beginning with an illustrated description of the Royal hot-water heaters, there follows a brief account of the principle of hot-water heating. Then a further notice of the Royal heaters, with the separate sections illustrated, and full tables giving dimensions, prices and other particulars. The Princess Royal combination hot-water and hot-air heater is next illustrated, followed by the Royal safety sectional steam heater.

A PATENT for a steam or hot-water heater has been granted to Arthur Boyce, St. Louis, Mo., the apparatus comprising a number of sectional rectangular-shaped frames, mounted upon one another and connected together, the waterways provided being vertical, as is also the course of the products of combustion.

THE LATEST POSTAL TRAVELER sent out by the United States Heater Company is a catchy invitation addressed to the trade, both East and West, to visit Detroit. The unanswerable argument is presented that in coming from the East Detroit is on the way, and every one should stop and see them, while coming from the West Detroit is but a little way from Chicago, and besides that is a city which "makes more stoves, radiators and more hot-water heaters than any other city on earth." Other attractions, such as cigars, beverages, &c., too numerous to mention are noted.

GORTON & LIDGERWOOD COMPANY, 96 Liberty street, New York, have received from the municipal authorities of Amherst, Mass., a very gratifying letter testifying to the efficiency of two of their Gorton boilers, which were installed two years ago in the new town hall of that city for heating purposes. This hall is a very handsome brick structure, erected in 1891. It is two stories in hight, 110 feet long by 60 feet wide. On the first floor there are four large office rooms, selectmen's room, town clerk's room, assessors' room, library, police court and a large corridor running nearly the entire length of the building. The second floor is mostly occupied with a large hall. It has a large stage at one end, with stage dressing rooms, &c., and seating accommodations for 700 people. The building being of considerable size, it was found expedient for the best heating results to employ two No. 5 Gorton patent side-feed steel boilers set in twin connection and so fitted that they could be run either separately or together, thus regulating the supply of heat according to requirements, and maintaining an efficient service with the least expense. The heating apparatus, which was erected by William W. Hunt, a prominent steam heating engineer of Amherst, is constructed on the double-pipe "gravity return" plan, and all pipes erected are of ample size to insure the active delivery of dry steam to the radiators and an easy flow of the water of condensation back to the boilers. The main steam pipe from the boilers is 3½ inches, and is gradually reduced to 2½ inches, 2 inches and 1½ inches. It is suspended from the ceiling of the cellar by adjustable hangers placed about 8 feet apart and extending upward therefrom are the requisite number of vertical pipes to supply the heating surface throughout the building with steam It is also provided with the necessary vertical drip pipes. The first floor is heated by 17 radiators, which in the aggregate contain 796 square feet of radiating surface, and the second by 16 radiators, which contain an aggregate amount of 1100 square feet, making a total of 1896 square feet of radiating surface in 33 radiators, heated by two No. 5 Gorton boilers. When the second floor is not in use only one boiler is run.

THE RAYMOND & CAMPBELL MFG. COMPANY, Middletown, Pa., issue an illustrated circular respecting goods of their manufacture. At the Susquehanna Iron Works, which is the plant of this firm, considerable attention is given to the manufacture of bells, several styles of which are illustrated in the circular. Other goods noticed are farm feeding troughs and a variety of grates, while among miscellaneous goods are adjustable shelving. At the close of the pamphlet attention is given to the Sun steam heater and the Sun hot-water boiler, which are illustrated with sectional views and briefly described in the text.

THE AMERICAN BOILER COMPANY of Chicago are distributing a very taking little circular inviting visitors to the World's Fair to call on them at 36 Dearborn street, and also to have mail sent in their care. The circular is printed on cardboard, with a deep border of crimson, and quaint old style lettering. The card is a folder, with a flap closing the ends. On opening it the invitation is seen in the interior in imitation of handwriting.

A CATALOGUE in the steam and hot-water heating line, notably pleasing in various ways, is issued by the Hopson & Chapin Mfg. Company, New London, Conn., in which they direct attention to their boilers and radiators for warming and ventilating by hot water. The pamphlet, of convenient size, is bound in dark-green paper, with the title of the firm printed in gold on the front cover. The printing has evidently been done in gilt and scarlet, which gives a certain irideacent effect to the lettering that is highly effective. Immediately after the title page is a plan and perspective view of the Hopson & Chapin Mfg. Company's foundry and machine shops; then follows a statement as to the business of the concern, which, as it is explained, is to do warming and ventilation. The first section which follows is given up to boilers, those illustrated and briefly described being the Hopson, the Pequot and the H. C. Monogram. Then come radiators, the Connecticut, the H. & C. Indirect and the Compound Radiator, which is a combination of a direct and a direct-indirect radiator. The D ventilating radiators are also illustrated and at the close of the pamphlet are a few pertinent tables. The publication is characterized by extreme straightforwardness and simplicity throughout. Extravagant claims are conspicuous by their absence, and what will to the ignorant seem a strange confession, the firm intimate that the efficiency of a heating plant depends rather on the way it is installed than on the particular make of boiler used. The paper, printing, illustrations and all the mechanical features of the pamphlet are in keeping with the tenor of the contents.

THE AMERICAN RADIATOR COMPANY, 111 and 113 Lake street, Chicago, send us a neat circular representing the globe on the exterior, with the grand divisions of the earth duly laid off and the depots of the company marked in their proper localities in North America. The circular is a folder, which treats of the company's radiators in the interior, stating that they are sold all over the world, and are used to heat the great World's Fair buildings in Chicago.

TRAPS AND VENTS.

THE DEATH OF ENOCH REMICK will remove a familiar face from the Plumbers' Convention this year. His burial took place on Saturday, May 27, from his home at 924 North Second street, Philadelphia.

WILLIAM H. LLOYD of Boston, Mass., is the patentee of what he calls a water-closet demonstrator. The patent refers to an advertising or exhibiting apparatus showing the course and action of the water in closets, lavatories, bowls and other receptacles, and has for its object to so truncate the fixture that a plane surface will be exposed to which a plate of glass may be attached and cemented so as to show the interior of the fixture.

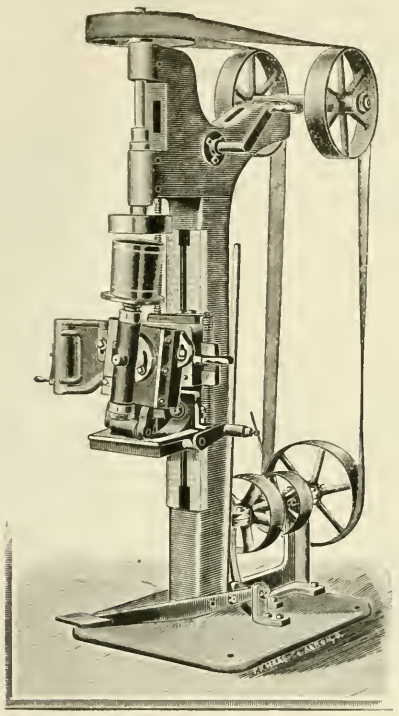
THE COLWELL LEAD COMPANY, 63 Centre street, New York, issue a notice to the trade that on account of the destruction by fire of their uptown branch store, they have opened a branch lead department in connection with William McShane & Co., 117 West Forty-second street, where they will keep a full stock of lead pipe, sheet lead, tin-lined pipe, block-tin pipe, pig and bar lead, solder, &c.

The blue book issued by Canada's Minister of Finance, after speaking of the loss of trade with the United States since the abrogation of the reciprocity treaty in 1866, refers to a standing offer on the statute books, "to make free or reduce the duties on certain named articles in case of equivalent reduction on the part of the United States," and intimates that overtures would be gladly renewed, but that an interchange of manufactured goods on a tariff basis involving discrimination against Great Britain is impracticable. On this last point all conferences held at Washington hitherto have split.

Not long ago the Canadian Pacific line shortened the time between London and Hong Kong to 21 days, and now the P. & O. steamers have cut down their record from 26 to 24 days between the same points. Still the Dominion route is one-eighth better.

Automatic Wiring and Imitation Wiring Machine.

Our engraving illustrates a new automatic machine which is designed for either genuine or imitation wiring of the edges of sheet metal packages. The machine is intended to make genuine or false wire on all kinds of cans, pails, picced tinware, measures, &c. It can be arranged to be operated on either tin, sheet iron or steel. It is capable of handling either straight or conical packages and will hem, roll, false wire or wire, as may be desired, it being only necessary to change the chucks according to the diameter of the work to be done. This machine is made by G. A. Crosby & Co., 170 South Clinton street, Chicago.



PATENT AUTOMATIC WIRING AND IMITATION WIRING MACHINE.

Discovery in Electrical Heating.

An account of what appears to be an extraordinary discovery is given in the report from Frankfort to the State Department of Consul-General Frank H. Mason. From advance sheets of the Consular reports for June we extract the following description:

A discovery so original and so wide in its practical application that it is believed to open a new and important chapter in the use of electricity for heating purposes has recently been announced from Brussels and tested at Berlin. The invention is the joint achievement of two Belgian scientists—Messrs. Lagrange and Hoho—who a few days ago applied to the Imperial German Patent Office for patents on a new method of heating, melting and refining metals by means of electrical heat. The means, as designated in their claim, were so simple and the results as therein described so incredible that the patent examiners demanded that before issuing the patent a practical demonstration of the process should be made in their presence. The matter was referred to an eminent and disinterested electrical expert at Berlin, who made the first essays in his private laboratory, and was so delighted with the result that he asked by telegraph permission of the inventors to repeat the demonstrations before the Electro-Technical Society at the German capital. Permission was readily granted, and the experiments were performed before a group of expert electricians with brilliant success. From the account given by one of the experts who was present at these demonstrations and from various other sources the following report of the new process has been derived:

The apparatus consists of a glass or porcelain vase, which may be of any size conveniently adapted to the purpose, provided with a lining of lead connected with a strong conductor of positive electricity. The vase is filled to three-fourths its capacity with acidified water. A pair of iron tongs with insulated handles is attached by a flexible conductor to the negative pole of an electrical current generated by an ordinary dynamo. With this simple and inexpensive equipment the following phenomenon is produced.

The electrical current having been switched on, a bar of wrought iron or other metal is taken up with the tongs and plunged into the water within the vase. Immediately the water begins to boil at the point of contact: the immersed portion of the iron rises quickly to a red, then to a white, heat, and emits a stream of brilliant white light. In a few moments the heat becomes so intense that the iron melts and falls off in bubbles and sparks, leaving a clear, glowing surface in perfect condition for welding. The heating process has been so rapid that neither the water nor the end of the bar held within the tongs have been more than slightly warmed, and, the current being switched off, the bar, with its submerged end glowing, may be readily held in the naked hand. If, instead of a bar of metal, a stick of carbon is used, the heat in a few minutes produces detached fragments of amorphous carbon, which proves scientifically that a temperature of 4000° Celsius has been developed. The rapidity of the heating and the limit of temperature to be reached are easily and accurately governed by the strength of the current employed, so that the whole process is under the absolute control of the operator. During the recent experiments at Berlin the measuring instruments registered a tension of 120 volts and an energy of 220 ampères. It was estimated that fully 50 per cent. of the current was directly utilized as heat, whereas the practical limit of such utility has not hitherto exceeded 20 per cent. It is stated by the inventors that by employing a still stronger current a temperature of 8000° Celsius has been developed. The mechanical importance of this fact will be apparent when it is remembered that this is a degree of heat nearly three times greater than that required to extract iron from the ores, the most refractory of which fuse at about 2700°.

Divested of all merely technical phraseology and reduced to its simplest terms, the process under consideration may be explained as follows: One of the well known effects of electricity is to separate compound fluid bodies through which it passes into their primitive elements. The current, passing through the tongs and metallic bar into the water, decomposes the latter into its two gaseous elements—oxygen and hydrogen. The oxygen is attracted and gathered on the relatively large surface of the lead lining and produces no noticeable effect. The hydrogen, on the other hand, gathers around the immersed portion of the bar; and as this has a comparatively limited surface area, it is immediately surrounded with a close envelope or jacket of hydrogen, which, being a bad conductor of electricity, creates a powerful resistance to the passage of the current and thus develops the heat which causes the bar to glow and melt. It is merely an application of the well-known law that friction or resistance to the passage of an electrical current causes heat, and the apparent paradox of a piece of cold metal plunged into cold water rising rapidly to a melting glow is as simply and clearly explained as the incandescence of a platinum coil in a vacuum bulb.

Boston, New York and Philadelphia are all agitated by rapid transit schemes, but the subject is perplexing and is slow in development. The latest plan under discussion in Boston involves an estimated expenditure of $25,000,000.

Cleveland architects are perfecting their plans for the manual training school building, which will be a handsome structure, with a stone front 100 feet wide.

THE TIN SHOP.

Pattern for Article Having 36 Sides.

From C. E., *Union City, Tenn.*—Can the pattern be obtained for an article having 36 sides, as shown in plan and elevation, Fig. 1, assuming that the top piece A′ B′ C′ D′ E′ of the elevation corresponds with A B C D E F G of the plan, and that the center piece B′ C′ D′ E′ L′ K′ J′ of the elevation also corresponds with B C D E F G H J K L M N of the plan? As will be observed from an inspection of the plan and elevation, the article is composed of 36 triangles.

Answer.—To obtain the pattern of top piece A′ B′ E′ of elevation, proceed as follows: With A′ B′ of elevation as radius, and any point as center, as *a* in Fig. 2, describe an arc indefinitely, as shown by *g z* of pattern. Draw *a g*. Set off on the arc *g z* spaces equal to G B, B C, &c., of plan, and connect the points by chords. Also from the points in the arc *g z* draw lines to the center *a*. Then *a g b c d e f z* is the pattern of part of article shown in plan by A G B C D E F, or A′ B′ E′ of elevation.

We will next obtain the pattern of triangle K′ D′ C′ of center piece, corresponding with K D C of plan. As the slant hight of this triangle is not given in the elevation, it will be obtained in the following manner. Draw the right angle S T U of Fig. 3. From T on T U set off the distance K W of plan, and from T on T S the hight of center piece, as shown by K′ X of elevation. Draw S U. Then the hypotenuse S U gives the distance between points K W of plan or K′ X of elevation. Draw the line *d c* of pattern in Fig. 4, in length equal to D′ C′ of elevation, or D C of plan. Bisect *d c* in *w* and erect the perpendicular *w k*, making it in length equal to the hypotenuse S U of Fig. 3. Draw *d k* and *k c*. Then *k d c* is the pattern of the triangle shown in plan by K D C and in elevation by K′ D′ C′.

An inspection of the plan will show that in obtaining the length of line K C of triangle K D C, as shown by *k c* of pattern, this distance is also the same as required for K C of triangle K C J and the sides of all the other triangles. Accordingly, to obtain the pattern of triangle K C J of plan, or K′ C′ J′ of elevation, proceed as follows:

With K J of plan as radius, and point *k* of pattern as center, strike a small arc (*j*), which intersect with one struck from point *c* of pattern as center and *c k* as radius, thus establishing point *j* of pattern. Connect points *k j* and *j c*, as shown. It will be observed that triangle *c b j* is a duplicate of *d c k*; that triangle *j b h* is a duplicate of *k c j*, &c. Then to obtain the pattern of center piece L′ E′ B′ J′ of elevation, it is only necessary to draw six triangles similar to *d c k*, and six triangles similar to *k c j*, alternating them as shown. To complete the article shown in Fig. 1, two pieces similar to those in Figs. 2 and 4 are required.

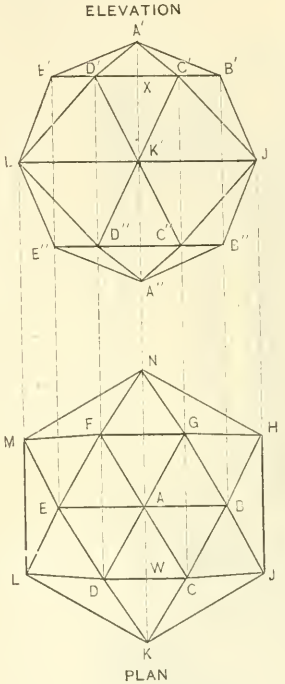


Fig. 1.—Elevation and Plan.

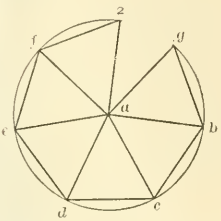

Fig. 2.—Pattern of Top Piece.

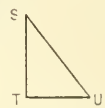

Fig. 3.—Triangle Representing Slant Hight of D C K of Plan.

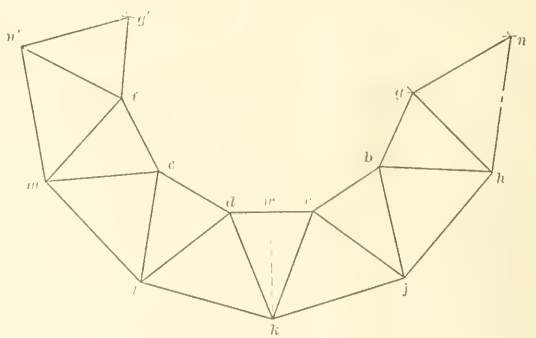

Fig. 4.—Pattern of Center Piece.

PATTERN FOR ARTICLE HAVING THIRTY-SIX SIDES.

THE RETAIL STORE.

The Crystal Valve Oil Can.

The accompanying cuts show the construction of an oil can being put upon the market by the Star Mfg. Company, Canton, Ohio. The can, Fig. 1, is described as consisting of a fine crystal glass reservoir of new and symmetrical pattern, protected with substantial metallic top and bottom bands, the bottom one having a flange extending far enough under the glass to protect it from injury, while the whole is bound together with a wire frame. It is pointed out that the handle is so adjusted as to nicely balance the can, and at the same time to admit of its being easily tipped for filling the lamp. The valves shown in Figs. 2 and 3 are referred to as especial novel features. When the can stands vertically the valves, it is stated, automatically close the vent at the top and the spout, rendering both perfectly air tight, as in Fig. 2. It is further stated that when the can is tipped to pour oil, as in Fig. 3, the valves open, thus obviating the necessity of a cap on the spout to prevent evaporation, as well as the unscrewing the can top to give the can vent.

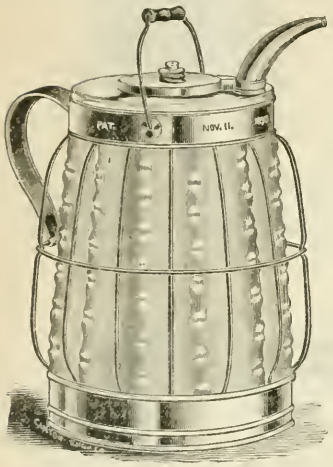

Fig. 1.—The Crystal Valve Oil Can.

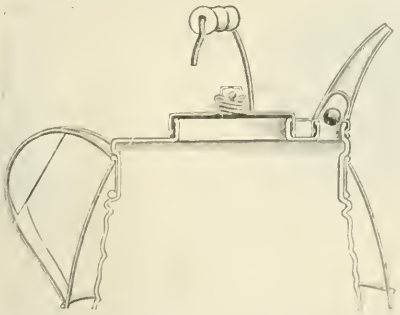

Fig. 2.—Valves Closed.

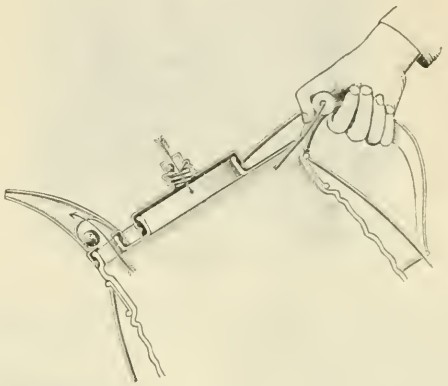

Fig. 3.—Valves Open.

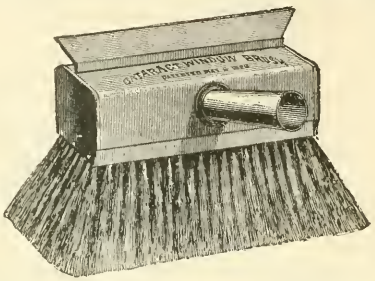
Self-Pouring Oil Can.

The Self-Pouring Oil Company, 1430 South Penn square, Philadelphia, Pa., are putting on the market the can illustrated herewith. The can is made with the breast and neck stamped from one piece, and with a curved spout, which is straight inside the can and reaches to the bottom. The lid, which closely fits inside the neck, is 5 inches long, stamped from brass, having a brass knob with a hole in its top forming an outlet to the lid. In operation the lid is raised by taking hold of the knob with the thumb and second finger; when raised sufficiently, the first finger is placed firmly over the outlet in the lid and the lid lowered until sufficient oil is poured, when the finger over the outlet is removed. Should there be too much oil in the lamp—that is, above the end of the spout in the lamp, it is explained that the surplus oil will be drawn back into the can when the finger is removed from the outlet. In pouring oil it is not necessary to lift the can. The manufacturers claim that a drop or lamp full of oil can be poured; that every drop can be poured from the can; that the spout cannot stop up, and that the oil is under control in pushing it forward into the lamp, drawing it back into the can, if desired, or stopping it instantly; also, that all the oil in a lamp can be drawn into the can. The point is made that the can is made with the finish and care so that it may be used in the dining room or library, and for handsome lamps which it is not desirable to take to the kitchen to be filled. The can is made without springs or packing, and to hold one gallon of oil.

Self-Pouring Oil Can.

Cataract Window Brush.

The window brush illustrated herewith is being introduced by the Enterprise Brush Company, 17–21 College place, New York. The wooden head of the brush is 3 x 8 inches in size, into which the horse-hair bristles are fastened. Above these is a metal reservoir, of the same size as the head and 2 inches high, to which a socket for handle is attached. On the top of the reservoir on the opposite side from the handle is a hole ⅜ inch in diameter. In the bottom of the reservoir are perforations corresponding to openings in the wooden head. When the reservoir is filled, by placing it in a bucket of water, the perforations permit a sufficient quantity of water to escape through the bristles upon the glass when washing windows. Upon the top of the reservoir is a rubber drier, which is brought into use by reversing the brush. The reservoir is finished in blue with gilt lettering.



Cataract Window Brush.

Movable Nail Bins.

The accompanying cut represents movable Nail bins, being introduced by W. J. Clark & Co., Salem, Ohio. The bins are made of sheet steel of a gauge or thickness sufficient to insure stiffness without needless weight. The top edge of the front and back ends are rolled so as to form hand holds, by which any one of a row of them can be drawn out from its place and lifted if need be to pour off its contents into scales or other receptacles.

They are made similar to bins generally used for such purposes—high at the back and low in front in order to show, and make it convenient to get at their contents. The sides are higher than the fronts, the object of which is to keep from spilling over the sides when they are lifted and tilted to pour from one corner.

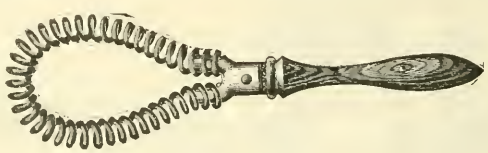
The bins are designed for Nails and other small articles of Hardware which are kept in bulk to be retailed from.

The company have recently furnished an Eastern retail Hardware store with them, the proprietors of which claim them to be an improvement on the common immovable bins.

Movable Nail Bins.

Boss Dust Beater.

The accompanying cut represents a dust beater manufactured by Peabody & Parks, Troy, N. Y. It is composed of a coil of steel wire secured in a galvanized malleable iron socket which is attached to an enameled wooden handle. The wire coil, including the socket, is 10½ inches long, the handle 11 inches in length, making the beater 21½ inches over all. It is designed to remove dust and filth from clothing, upholstered furniture, rugs and carpets. The manufacturers claim the beater will raise the nap, thus improving the appearance, also that it will not leave marks or tear the fabric.



Boss Dust Beater.

The discovery of a rich petroleum field is reported in Assam, East Indies. A company under the title of the Assam Oil Syndicate, is about to open up the oil resources of that region, which are said to be very promising.

Spray Pump and Nozzle.

The accompanying cuts represent articles being put on the market by The Deming Company, Salem, Ohio. The

Fig. 1.—Double-Acting Brass Spray Pump.

Gem Spray pump, shown in Fig. 1, is described as having all working parts of brass, galvanized air chamber, and as furnished with Mystery combination spray nozzle. As shown in the cut, the pump is used in a common wooden bucket. By detaching the foot rest and clamp the pump may be placed over the bunghole or on the end of a barrel; an additional piece of ¾ inch suction pipe only being necessary to adapt it for use this way.

The spray, Fig. 2, is referred to as an improvement in this direction, as throwing a fine spray and as being simple in construction. It is provided with a degorger and button threaded for lance, as used in their Knapsack sprayers.

Fig. 2.—Vermorel Spray Nozzle.

The experience of recent fast steamers at Queenstown shows that merchants in New York can post letters to London and receive replies thereto within the extraordinary time of 14 days. Liverpool papers still claim the superiority of Queenstown as a mail station compared with any other port.

Flexible Pot and Kettle Cleaner.

The Clauss Shear Company, Fremont, Ohio, are introducing the cleaner illustrated herewith. It consists of stamped handles hinged at one end to a flexible steel blade and fastened together at the other end by a metal clip. The blade is made of clock spring and the handles of nickel plated steel. It is designed to clean anything, whatever its

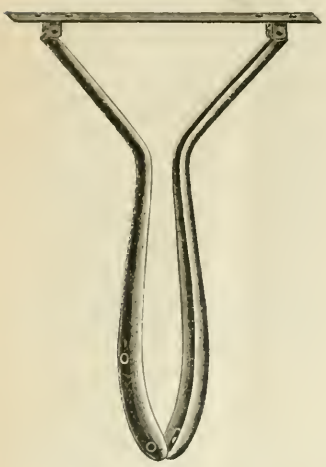


Fig. 1.—Flexible Pot and Kettle Cleaner.

shape, including corners, angles and flat and round surfaces in any kind of kettles, skillets, sinks, chopping bowls, tables, cupboards, molding boards, rolling pins, bread pans, pie pans and pudding pans. It is suggested that fish are easily cleaned by it and that it is useful in scraping the wall in house-paper-

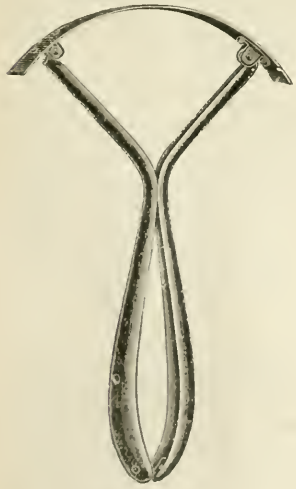

Fig. 2.—As Used for Round Surfaces.

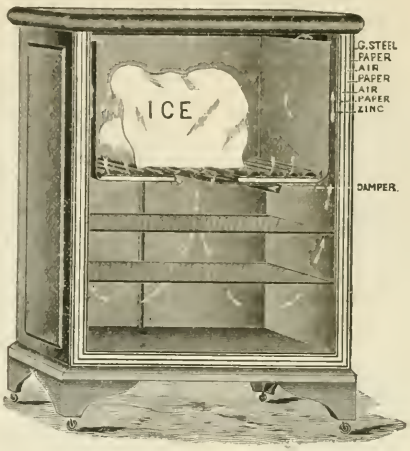
ing time. The point is made that it is not necessary to soil the hands by putting them in hot or greasy water or other offensive contents of the vessel to be scraped, and that danger of cutting or burning the hands is avoided.

Steel Clad Air-Tight Refrigerator.

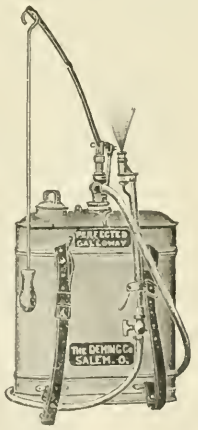
The accompanying cut represents a refrigerator being put upon the market by the Battle Creek Metallic Refrigerator Company, Battle Creek, Mich. The refrigerator is built of galvanized steel, with a removable ice box; shelves of woven steel wire galvanized, and with a trap which the manufacturers claim cannot lose off or become misplaced. The damper for controlling the consumption of ice is referred to as a new feature, by which, it is stated, the cost of ice is reduced about 25 per cent. The outside walls, bottom and top, front and doors are described as being perfectly air tight, with double dead air spaces, constructed as indicated in the cut. The manufacturers claim for the refrigerator that there can be no communication with the outside air; that it cannot be effected by changes in temperature; that there is no wood in the ice or provision chambers to decay or to become contaminated; that it is of comparative light weight, and that it has a large storage capacity in proportion to its outside measure. These refrigerators are made in five sizes, from 24 to 34 inches in width, 14 to 20 inches in depth, and from 40 to 47 inches in hight.



Steel Clad Air-Tight Refrigerator.

The Perfected Galloway Knapsack Sprayer.

The Knapsack Sprayer, herewith shown, and offered by the Deming Company, Salem, Ohio, consists of a copper tank arranged to strap on the back and a brass pump operated by a rod attached to the lever. The pump is described as being so constructed that all leakage from the stuffing box will drip back into the tank; also that, if it becomes necessary, the entire pump can be taken out for repairs without the least trouble. The pump, it is remarked, is fastened firmly in the tank, and, being placed in the center of the same, is supported by the central brass casting, admitting of its use for either right or left hand without shifting the position of the straps. A strainer is arranged at the top of the tank to prevent any deleterious material from entering the tank and pump, and the discharge is provided with six feet of ¼-inch rubber tubing; also with the Deming improved spray nozzle, with lance and degorger. This nozzle is referred to as making a fine, mist-like spray. The device is designed for use by grape growers, florists, gardeners &c., for spraying grape vines, potato



The Perfected Galloway Knapsack Sprayer.

plants and small orchards, where the work is necessarily done by one man.

O. & L. OATMAN, hardware and stove dealers at Medina, Ohio, have changed their firm name, and hereafter the business will be conducted under the style of Oatman Brothers.

Export statistics from the bureau at Washington show that there is a comparative increase in the foreign demand for Indian corn. It is important that Europe should know the value of corn as a food product.

The Argentine Government have ordered from England a floating dry-dock for the use of the Argentine navy.

Western Foundrymen's Association.

A meeting of Western foundrymen was held on May 25, in the rooms of the Detroit Foundry Equipment Company, Temple Court, Chicago, for the purpose of organizing an association. The call for the meeting had been signed by the following firms and corporations:

Fraser & Chalmers, Chicago.
The Sargent Company, Chicago.
Allen Foundry Company, Detroit.
The Lloyd Booth Company, Youngstown, Ohio.
The Globe Iron Works Company, Cleveland, Ohio. J. F. Pankhurst, General Manager.
The General Engineering Company, Harvey, Ill.
Dayton Malleable Iron Company, Dayton, Ohio.
J. N. Barr, Superintendent Motive Power, C., M. & St. P. Railway Company, Milwaukee.
Lake Shore Iron Works Company, Marquette, Mich.
Thos. D. West, Thos. D. West Foundry Company, Sharpsville, Pa.
Walburn-Swenson Company, Chicago.
F. E. Drury, Cleveland Foundry Company, Cleveland, Ohio.
Detroit Foundry Equipment Company. J. H. Whiting, President, Detroit, Mich.
Gobeille Pattern Company, Cleveland, Ohio.
Patch & Swift, Streator, Ill.
Craig-Reynolds Foundry Company, Dayton, Ohio.
Shaw, Kendall & Co., Toledo, Ohio.

Those who met in compliance with the call were as follows:

C. A. Sercomb. Schwab & Sercomb, Milwaukee, Wis.
S. H. Holley, Lake Shore Foundry Company, Marquette, Mich.
Wm. Hardee, Shaw, Kendall & Co., Toledo, Ohio.
J. Bowie, Walburn-Swenson Company, Chicago Heights, Ill.
J. L. Gobeille, Gobeille Pattern Company, Cleveland, Ohio.
C. M. Conradson, Fuller & Johnson Mfg. Company, Madison, Wis.
J. E. Griffen, South Milwaukee Malleable Iron Company, Milwaukee, Wis.
James Frake, formerly L. M. Rouse & Co., Chicago.
John M. Sweeney, General Engineering Company, Harvey, Ill.
A. L. Patch, Patch & Swift, Streator, Ill.
H. W. Hurlbut, Hurlbut Mfg. Company, Racine Junction, Wis.
C. A. Plamondon, A. Plamondon Mfg. Company, Chicago.
Theo. P. Byram, Byram & Co., Detroit, Mich.
Chas. S. Reed, Chicago Retort & Fire Brick Company, Chicago.
H. S. Vrooman, Garden City Sand Company, Chicago.
J. H. Whiting and A. T. Whiting, Detroit Foundry Equipment Company, Detroit and Chicago.
W. D. Sargent, Sargent Company, Chicago.
Franklin Moeller, Webster, Camp & Lane Machine Company, Akron, Ohio.
A. I. Findley, *Iron Trade Review*, Cleveland, Ohio.
B. M. Gardner, *Iron Trade Review*, Cleveland, Ohio.
J. A. Penton, *The Foundry*, Detroit, Mich.
Geo. W. Cope, *The Metal Worker*, Chicago.

Mr. Findley called the meeting to order, stated the purpose of the gathering and asked for nominations for chairman. C. A. Sercomb was named and unanimously elected, making a short but very practical address on taking the chair. A. T. Whiting was elected temporary secretary. Letters were read from Thos. D. West of Sharpsville, Pa.; Indiana Car & Foundry Company of Indianapolis, Ind.; R. C. McKinney, Niles Tool Works, Hamilton, Ohio; W. J. Keep, Michigan Stove Company, Detroit, Mich.; Sandusky Machine & Agricultural Works, Sandusky, Ohio; John T. Noye Mfg. Company, Buffalo, N. Y., and the Lane & Bodley Company of Cincinnati, regretting inability to attend, but expressing themselves strongly in favor of the organization of an association for mutual benefit. A communication from Francis Schumann, president of the Foundrymen's Association of Philadelphia, giving some points regarding the benefits of an association, was also read. In reply to a question Mr. Findley stated that invitations to attend the meeting had been sent to some 300 foundrymen in the central West.

General remarks having been called for by the chairman, Mr. Plamondon gave a brief statement of the Chicago local association, which had been formed some six months since to handle labor troubles. It numbered some 60 members at first, but as a disposition was evinced to deal with the molders' strike individually, interest in the association gradually subsided, and recent meetings had been very slimly attended. He welcomed the formation of an association of this character. Mr. Gobeille dwelt upon the educational advantages of an organization, giving some practical illustrations showing the necessity of foundrymen acquiring a better knowledge of their business, which could be gained to a great extent through the interchange of ideas and experiences. He advocated supporting a laboratory with an expert founder and chemist in charge, to test various brands of iron, experiment with mixtures, and report regularly for the benefit of the members so that they might have reliable data to govern them in their efforts to secure good castings. He thought that more precise technical knowledge on this subject would not only improve the work turned out, but would also enable a decided saving to be made in cost. Mr. Sweeney spoke on the subject of introducing more scientific methods in the operation of foundries, declaring that a chemist was almost an indispensable part of the working force. Mr. Penton thought that in organizing an association the question of wages and prices of castings should be avoided, leaving them for settlement by local associations. The association should be purely educational.

A desultory discussion followed, in which this view of the scope of the association was generally supported.

Motions were then made and carried declaring the organization permanent and providing for the appointment of a committee to prepare a constitution and by-laws. This committee consisted of Messrs. Sweeney, Penton, Conradson and Findley. It was resolved that all firms, corporations or persons who had agreed to attend the meeting, who have attended or written their approval of the objects of the organization, shall be entered by the secretary as members.

The draft of a constitution and by-laws was then reported by the committee, based on the plan of the Foundrymen's Association of Philadelphia, the organization to be styled the Western Foundrymen's Association, admission fee $5, dues $4 per year; monthly meetings to be held on the third Wednesday of each month at 7.30 p. m., the annual meeting on the third Wednesday in May, and headquarters to be located in Chicago. Persons, firms or corporations practically engaged as employers in the production of castings or persons whose services or knowledge is valuable toward the objects of the association are eligible to membership.

After the adoption of the constitution and by-laws a Committee on Nominations of Officers for the ensuing year was appointed, consisting of Messrs. Sargent, Patch and Conradson, who shortly afterward recommended the following list, which was unanimously elected: President, C. A. Plamondon; vice-president, J. M. Sweeney; secretary, B. M. Gardner; treasurer, A. L. Patch. Executive Committee, C. A. Sercomb, S. H. Holley, Geo. W. Cope, J. E. Griffen and J. A. Penton. A resolution of thanks to the Detroit Foundry Equipment Company for the use of their rooms was adopted. The association then adjourned to meet on June 21 at the same place.

Notes From the World's Fair.

The exhibit of the American Kaolin Works of 223 South Third street, Philadelphia, is interesting to both the stove and foundry man. It shows crude kaolin, washed kaolin, fire clay, ball clay and silica, such as is used in the manufacture of high grade linings for stoves, cupolas and retorts.

Pugh & Grovenor of Casselton, N. Dak., show their heating and ventilating drum for utilizing the products of combustion from a stove to heat a room above. The ventilating is accomplished by a tube taking the air from the floor under the drum and discharging it into the smoke pipe. The drums are finished in planished iron and copper and present a fine appearance.

An interesting feature of the exhibit of the Potters' Supply Company of East Liverpool, Ohio, is the various-sized stilts, shown in several different shapes in their natural color, pure white, in glass jars. They are used at the potteries to place between the ware in the kilns, but the genius of the gas-stove man bring them into use to cover the burner in a gas stove. The gas flame then plays through them, changing them to an incandescent mass of great radiating power, and a claim is made that combustion is improved.

We are in receipt of a copy of the catalogue of the Odd Fellows' Home of Connecticut, known as Fairview, located at Groton, New London County, Conn. The volume contains an interesting account of the institution, giving views of the house and the neighboring country, as well as a full description of the home, its origin, &c. Two interesting poems are contributed by J. H. Cloyes, one of them entitled "Fairview—A Pen Picture," and the other being a poem written for the dedication, which took place on April 26.

England, like the United States, suffers from the lessened purchases of manufactured cotton by China.

STOVE TRADE NOTES.

THE TWENTY-SECOND Annual Stove Convention

Meetings of the National Defense Association and the National Association of Stove Manufacturers.

The manufacturers of stoves were favored with a variety of weather, generally pleasant, this week while holding their annual convention in Chicago. The attendance was perhaps not so large as had been expected, in view of the attractions this year in the World's Fair city. It was, however, sufficiently large to show that interest in the National Association has by no means faded. Some familiar faces were missed, but others were seen in their places. Not a few manufacturers appeared who had for some time withdrawn from active participation in the affairs of the association. The question of expense in the maintenance of the organization had cut no little figure in this respect, and the reduction made in annual dues brought back some of the wanderers. The meetings were held in the club room of the Palmer House.

Meeting of the Defense Association.

The Stove Founders' National Defense Association met on Tuesday afternoon at 2 o'clock, with Henry Cribben, president, in the chair. About the usual number of members were in attendance. Reports were read by the president, secretary and treasurer, reviewing the work of the past year. The election of officers for the ensuing year was taken up in its regular order, and in view of the fact that reports were in circulation of widespread dissatisfaction with the secretary, a motion prevailed that an informal ballot should be taken on this office. A secret ballot was then cast and D. M. Thomas received all the votes but one. Formal nominations were then made, and the old list of officers was unanimously re-elected. The salary of the secretary was advanced 50 per cent. on the amount paid last year. This is a remarkable vindication of Secretary Thomas in view of the bitterness of some of the attacks made on him. The regular committees were then appointed to carry on the formal work of the association. There was some discussion of cupola practice, after which the meeting adjourned.

The full list of officers of the Defense Association for the ensuing year is as follows:

President, Henry Cribben of Chicago.
Vice-President, W. T. Bradberry of Pittsburgh.
Secretary, D. M. Thomas, Union Trust Building, New York.
Treasurer, A. C. Mott of Philadelphia.
Chairman of Committee for the Second District, Grange Sard of Albany, N. Y.
Chairman of Committee for the Third District, W. W. Baldwin of Cleveland, Ohio.
Chairman of Committee for the Fourth District, Chauncey H. Castle of Quincy, Ill.

Meeting of the National Stove Association.

WEDNESDAY MORNING.

At 11 o'clock, Wednesday morning, the first session of the National Association of Stove Manufacturers was opened by President Geo. D. Dana, with the following gentlemen in attendance:

W. P. Abendroth, Abendroth Bros., New York.
Lew. A. Anshutz, the Anshutz Bradberry Company, Pittsburgh.
W. J. Anderson, Richmond Stove Company, Richmond, Va.
S. R. Baldwin and John S. Graham of Baldwin & Graham, Pittsburgh.
W. W. Baldwin, Cleveland Co-operative Stove Company, Cleveland.
George H. Barbour, Michigan Stove Company, Detroit.
Joseph Bell of Joseph Bell Stove & Range Company, Muncie, Ind.
H. W. Bennett, Indianapolis Stove Company, Indianapolis, Ind.
James Boyle of James Boyle & Son, Salem, Ohio.
Wm. K. Boal, Favorite Stove & Range Company, Piqua, Ohio.
Stanhope Boal, Favorite Stove & Range Company, Piqua, Ohio.
A. M. Blakesley, Rock Island Stove Company, Rock Island, Ill.
W. T. Bradberry of Anshutz-Bradberry Company, Pittsburgh.
N. Brayer, Co operative Foundry Company, Rochester, N. Y.
August Brentano of Kiechle, Brentano & Oberderfer, Evansville, Ind
W. L. Bridgeford, Bridgeford & Co., Louisville, Ky.
W. T. Bussey, Chicago Stove Works, Chicago.
J. B. Copp, Peninsular Stove Company, Chicago.
N. L. Canfield, Danville Stove Works, Danville, Pa.
C. H. Castle, Comstock-Castle Stove Company, Quincy, Ill.
Henry Cribben, Cribben, Sexton & Co., Chicago.
G. J. Cottrell, Quincy, Ill.
James Duffy, Duffy-Trowbridge Stove Company, Hannibal, Mo.
James Dwyer, Peninsular Stove Company, Detroit.
Jeremiah Dwyer, Michigan Stove Company, Detroit.
Jeremiah J. Dwyer, Peninsular Stove Company, Detroit.
C. A. DuCharme, Michigan Stove Company, Detroit.
George D. Dana, Excelsior Mfg. Company, St. Louis.
B. W. Dobson, Detroit Stove Works, Chicago.
P. W. Elliott, Highland Foundry Company, Boston.
S. H. Emery, Jr., Bonnett & Nance Stove Company, Quincy, Ill.
John W. Evans, Bloomington Stove Company, Bloomington, Ill.
C. H. Filley, Excelsior Mfg. Company, St. Louis.
J. W. Emery. Channon-Emery Stove Company, Quincy, Ill.
Fred. W. Gardner, Michigan Stove Company, Chicago.
J. D. Graff, Graff & Co., Pittsburgh.
Arthur C. Hamilton, Co-operative Stove Company, Bloomington, Ill.
Fred. Hawkins, Fuller Warren Company, Chicago.
John E. Hunter, Culter & Proctor Stove Company, Peoria, Ill.
Geo. H. Holland, Bridge & Beach Mfg. Company, St. Louis.
Uriah Hill, Jr., Union Stove Works, Peekskill, N. Y.
J. W. Hobbs, Keokuk Stove Works, Keokuk, Iowa.
T. J. Hogan, Bridge & Beach Mfg. Company, St. Louis.
W. E. Joseph, Patton Mfg. Company, Columbus, Ohio.
Lazard Kahn of F. & L. Kahn & Brothers, Hamilton, Ohio.
E. W. Kasten and William F. Heyd of Brand Stove Company, Milwaukee.
L. W. Kingsley, Eugene Munsell & Co., New York.
Francis Keenan, Syracuse Stove Works, Syracuse, N. Y.
J. M. Kelly, Lexington Foundry Company, Lexington, Ky.
J. A. Lansing, Scranton Stove Works, Scranton, Pa.
D. G. Littlefield, Littlefield Stove Company, Albany, N. Y.
R. Liebel, South Erie Iron Works, Erie, Pa.
Wm. McAlpin, Bridge & Beach Mfg. Company, St. Louis.
Edward P. Mott, Abram Cox Stove Company, Chicago.
D. McAfee, Thomas White Stove Company, Quincy, Ill.
M. B. Mills, Michigan Stove Company, Detroit.
W. N. Moore, Joliet Stove Works, Joliet, Ill.
Albert Moffatt and J. H. Wells of Collins & Burgie Company, Chicago.

Chas. H. Myerhoff, Kahn, Myerhoff & Co., Evansville, Ind.

Abram C. Mott, Abram Cox Stove Company, Philadelphia.

J. Allison Orr, Mount Penn Stove Works, Reading, Pa.

Chas. S. Prizer, Reading Stove Works, Orr, Painter & Co., Reading, Pa.

Nathan B. Perry, Perry Stove Company, Albany, N. Y.

W. S. Patton, Patton Mfg. Company, Jeffersonville, Ind.

W. H. Peckham, Sill Stove Works, Chicago.

W. H. Pfahler, Abram Cox Stove Company, Philadelphia.

I. B. Resor, Wm. Resor & Co., Cincinnati.

R. G. Rennolds, Richmond Stove Company, Richmond, Va.

Edmund Raftery of Rathbone, Sard & Co., Chicago.

S. C. Rogers, official stenographer, Albany, N. Y.

Grange Sard, Rathbone, Sard & Co., Albany, N. Y.

W. S. Stevenson, Thomas, Roberts, Stevenson Company, Philadelphia.

Fred. Sauter, Belleville Stove Works, Belleville, Ill.

W. M. Shaddinger, Detroit Stove Works, Detroit, Mich.

C. D. Shepard, Peekskill Stove Works, Peekskill, N. Y.

W. H. Sard, Rathbone, Sard & Co., Chicago.

H. Scivard, Mount Penn Stove Works, Reading, Pa.

D. M. Thomas, secretary, New York.

George Thompson, Enterprise Stove Company, Vincennes, Ind.

Henry Terstegge, Terstegge, Gohmann & Co., Louisville, Ky.

C. H. Trowbridge, Dufly-Trowbridge Stove Company, Hannibal, Mo.

J. W. Van Cleave, Buck's Stove & Range Company, St. Louis.

De Witt Van Evera, Brand Stove Company, Chicago.

J. Van Wormer, J. Vau Wormer & Co., Albany, N. Y.

Henry Wilson, Thomas White Stove Company, Quincy, Ill.

W. E. Walker, Weir Stove Company, Taunton, Mass.

William Wewers, Gem City Stove Mfg. Company, Quincy, Ill.

George W. Willcox, the Bain Mfg. Company, Charleston, Ill.

Frederick Will, Sill Stove Works, Rochester, N. Y.

N. S. Walls, J. Van Wormer & Co., Albany, N. Y.

G. G. Wolfe, Fuller & Warren Company, Troy, N. Y.

W. H. Whitehead, Chicago & Erie Stove Company, Erie, Pa.

Arthur W. Walker, Walker & Pratt Mfg. Company, Boston.

H. Leonard Wilton, Art Stove Company, Detroit, Mich.

Auxiliaries.

Quite a number of the usual representatives of auxiliary branches of trade were also in attendance, as follows:

C. H. Matthews of the Ireland & Matthews Mfg. Company, Detroit, Mich.

E. A. Ireland of the Matthews & Willard Mtg. Company, Waterbury, Conn.

H. C. Matthews of Waterbury, Conn.

Henry Gleason of New York.

John E. Gately of Troy, N. Y.

Burton J. Mosier, with E. Reed Burns, Brooklyn, N. Y.

W. F. Greene of Troy, N. Y.

C. E. Brackett of American Stove Association, Chicago.

F. C. McDonald and Frank Baker of *Stoves and Hardware Reporter*, St. Louis.

A. O. Kittredge, James W. Nagle, W. A. Douglass and Ernest R. Kittredge of *Metal*, New York.

David Stern and Sidney P. Johnston of the *American Artisan*, Chicago.

J. C. Hendricks and W. M. Blair of the *Ironmonger*, Chicago.

David Williams, J. K. Hanes, Frank K. Chew and Geo. W. Cope of *The Metal Worker*, New York.

President Dana delivered an address, and Secretary Thomas read his report. A new departure was taken in refusing to make these public. It is thought best by the present officers that official proceedings and papers should not be published, on the ground that stove manufacturers should take enough interest in an association looking after their particular benefit to attend the meetings. By attending, they will greatly promote the objects of the association, whereas their absence diminishes the effect of the periodical meetings and retards the usefulness that an organization of this character is expected to exert. The report of Treasurer W. S. Stevenson was then read, showing a goodly balance on hand at the end of the fiscal year.

A paper on "Traveling Salesmen" was then read by C. S. Prizer of Orr, Painter & Co. of Reading, Pa. On account of the length of this paper we have to delay its publication until our next issue. A paper by C. D. Gibbons of Shiunick, Woodside & Gibbons, Zanesville, Ohio, read in his absence by Secretary Thomas, is as follows :

Co-operation.

At the meeting of the association held at Cleveland in May, 1886, I offered some resolutions, accompanied by a few remarks, bearing upon this subject. Other ideas seemed to prevail at that time, and no action was taken upon the subject.

The venerable and lamented John S. Perry also presented a plan at that meeting looking to the same object, which met the same fate. Other members discussed the subject at considerable length, but nothing was done to relieve the membership from the difficulties which all felt we were laboring under—viz., unremunerating prices.

The new organization formed at that time was good, and met one of the difficulties then confronting us, but it did not go far enough—it did not provide for the great question of remuneration. What our people wanted then, and still want, most of all, is adequate compensation for the capital, risk and labor employed in our business.

The channels of thought, and of legislation as well, at present seem to ignore all claims of capital to recognition, and yet, while this may be well, I am unable to see how the business of the country is to be conducted without the co-operation of capital, business methods and labor. It seems to me that the rights of each should be equally recognized and protected.

In all this spasmodic rush of sympathy for the toiling millions, let us not forget that business men have some claim to recognition also. Their activities transform the face of the earth. They whiten the seas of every clime with the sails of commerce, explore the hills and valleys in remote quarters of the globe to find products to meet the wants of men. They delve into the earth to bring forth its mineral wealth. Capital, which blesses the world, is a result of their applied energy. The money of the world has been created to meet the exigencies of business. The enterprise of untiring business men in every department of human activity gives employment to the toiling thousands, and makes possible the prevailing comfort.

Experience and observation have confirmed me in the opinion then expressed, and I am fully confirmed that the only plan by which our business can be placed upon a paying basis is full and complete co-operation.

The stove founders of America have within their control a business, which, if wisely managed, may be made remunerative to themselves and largely beneficial to the country generally.

An industry of whatsoever character, which is not on a paying basis, is necessarily detrimental to the general prosperity, and must sooner or later bring disaster, in proportion to its importance, to the community in which it is located. All experience has shown that the best way to build up a town or city is for its manufacturers and business men to build up their own business, and the prosperity of the town or city is assured. So in a State or nation—it is the individual prosperity of its citizens that makes the State or nation prosperous.

In order, therefore, that we, controlling one of the most important products of the nation, may contribute our share to the general prosperity, we should see to it that our business is so conducted as to yield a reasonable revenue.

Whatever may be the cause of the present condition of the stove trade, it should be removed. The difficulty, no doubt, is competition among ourselves. This cannot be remedied or regulated except by the co-operation of all those engaged in the business.

It will not do to say that, because many of us had a fair business, comparatively, last year, business is improving and we may expect success in the future. Last year was a phenomenal business year, brought about by a combination of circumstances which may not, and probably will not, occur again in many years to come. Some of us were enabled last year to dispose of some of our surplus stock and thereby humiliate the tax fiend; but these goods were generally sold at unremunerative prices. Even now we are realizing the effects of an anticipated change of national policy, in the timidity of capitalists to invest in manufacturing or other enterprises. This condition must continue and increase until it permeates the entire business of the country, and harmony and prosperity will be restored only when a settled policy is arrived at and confidence re-established.

During all this time consumption will be curtailed, competition will be-

come fiercer, and profits will be out of the question, unless an agreement can be had by which we can act together in the matter of prices. With increased production and lower prices it is not difficult to foresee the consequences.

There is scarcely a manufacturing business of importance in the country that does not have some system of co-operation excepting ours. It remains for us to devise some means, to adopt some plan by which our business may be placed upon a more secure basis.

Many different plans have been suggested to bring the stove manufacturers into closer relations to each other, none of which, so far, have been successful.

I would suggest that at this meeting a committee be appointed for the purpose of formulating a plan looking to a general co-operation of the stove manufacturers of the country, and that said committee be authorized to call a special meeting of the association when ready to report, if they deem it necessary; otherwise to report at the next regular meeting.

Let us take hold of this question with an earnestness and determination which will insure success. We owe this to our employees as well as to ourselves.

Let us put our business in such shape that we will be enabled to pay our operatives fair, liberal compensation for their services. There is no class of workmen who deserve better pay, because none perform more laborious service. None are more faithful, none bring a higher degree of skill and intelligence into their work, and none are more deserving of the confidence of their employers.

These papers led to an interesting discussion, participated in by a considerable number of the members, after which the committee on prices made their report.

WEDNESDAY AFTERNOON.

The committee on local associations made their report, which led to a discussion that disclosed a very strong sentiment in favor of the maintenance of such organizations. The committee on piracy of patterns reported that the subject was so well considered at the last meeting that no further action seemed necessary to be taken. The committee on transportation rates asked to be continued, because some changes were to be made by the transportation companies, which had prevented the committee from accomplishing what had been hoped. The committee on prices made a good report. The following paper by W. J. Keep was then read by Secretary Thomas in Mr. Keep's absence:

Cupolas—Their Construction and Management.

Many years ago we measured every cupola of any importance in Troy and Albany, and in many other cities, and learned the shape of the lining when first put in. We procured a record of charges, blast, speed of melting, &c., and tabulated the results, expecting to discover some general correct principles of construction and management, but on the contrary found nothing to show that any shape or kind of management could not be equaled by others. A cupola with a foundry full of piece workers is not a profitable thing to experiment with. If you hear of a melter that can do better than your own, it is better to borrow him for a couple of weeks to remedy your defects, and you can then imitate his management. A few years ago the Michigan Stove Company hired a melter from Mr. Smyser to increase the rapidity of their melting, and we have retained the shapes for our cupolas which we adopted at that time.

We shall confine our remarks to cupolas from which the iron is caught by the men who use it, and who carry it away as fast as it is melted.

SIZE.

Small foundries may need a cupola of small capacity, but if there is any chance of the business growing, it is better to have the outside diameter about 6 feet, and if necessary line it smaller for a few years.

A 6-foot cupola ought to deliver a constant stream without stopping during the heat that will give a line of men all that they will want to do to take care of the iron. This would fill a 40-pound ladle every six seconds, and would melt from 10 to 11 tons per hour.

As it is difficult to gauge the stream, it is more general to fill from 75 to 150 ladles in five seconds each, and then stop up for a couple of minutes. The rule should be to give the iron as fast as the men can take it away and return for another dip.

The most economical foundry is one employing enough men to take about 16 tons of iron delivered from a 6-foot cupola in from one and a half to one and three quarter hours.

SHAPE.

This is not the same for coke as for coal. The tuyeres for coal are often from 5 to 7 inches above the sand bottom, while for coke the distance should be from 14 to 18 inches. It is necessary, therefore, to determine the fuel before procuring a cupola. Equally good results are obtained with a cupola perfectly straight on the inside as with other shapes.

The rule in blast-furnace construction is to allow the lining to burn into any form that it chooses to take, and the next time to line the furnace with the same lines. This is a good rule if we wish to experiment with a cupola at all.

When the bottom is dropped it will be found that the melting point is within 2 feet of the tuyeres, and that the lining has burned away considerably at that point. The slag will be built out above the tuyeres by the chilling action of the blast. It is customary to chip away this slag and patch the sides. This does little good, as the daubing melts off in a few moments after the blast is on.

If only the deepest holes are mended and the slag is allowed to remain and is daubed with fire clay, in a few days a bosh will form and the lining will cease to burn away.

If the result is an improvement the same shape can be retained when the cupola is relined. There will be no trouble about having a clean drop. The melting point is held in the center so far away from the walls that they are not heated nearly as much as with straight sides.

A 4 inch lining above the melting point will last a long time. This gives much more room for iron than a 9-inch lining, and therefore hastens melting. The bosh is above the tuyeres, and if you began with a 9 inch lining and a straight cupola, and have let the cupola shape itself, you will have worked a bosh in 6 inches over and beyond the tuyeres, and will have worked the lining above the bosh to 4½ inches thick. The inside diameter above the bosh will be 62 inches. The bosh at the narrowest point is 42 inches, and the diameter below the tuyeres will be 56 inches. The sand bottom will be 7 inches thick, and from this to the tuyeres will be about 18 inches. The tuyere opening will be 5 inches high. From the top of the tuyere for 12 inches the lining will slope inward to the narrowest opening of the bosh. The lining will then gradually expand for 20 inches until a 4½-inch wall is reached.

The heat after leaving the melting point is absorbed by the fuel and iron above it, and the higher the charging door the better.

A charging door on each side is convenient, allowing fuel and scrap to be charged on one side and iron and sprues on the other. The hight of the stack will depend on the neighborhood. A high stack will carry the gases above the surrounding houses. It is difficult to construct a netting that will arrest the sparks or that will last.

Below the tuyeres, above the bosh and above the charging doors, flanges should be riveted to the shell, so that any section of the lining can be removed at any time without disturbing any other part.

Bricks costing from $12 to $20 last nearly as well as those costing twice as much, though they are not quite as large.

BLAST AND TUYERES.

Probably the preference would be for a positive blast. It will start off at about 10 ounces, and, as the cupola clogs up, will run up to 14 or 15 ounces. An increase of the blast above this will amount to the melting of about 1 ton additional per hour for each ounce increased, though some have had a different experience.

The piping from the blower to the cupola should be large, with very large curves, if any are necessary. The large pipe, say 18 inches diameter, acts as a reservoir, and if long, two cupolas may be driven with one positive blower, which would be expected to drive only one. A large water gauge should be attached to each cupola in such a way that the figures can be seen 25 feet away. The one that we use has a reservoir underground holding 3 gallons, and is made of 3-inch gas pipe, with a copper float. It has required no attention for eight years. The wind should enter a bustle at three sides. The bustle should be large and should extend all around the cupola, and should contain eight or ten large doors easily opened. The tuyeres should be about 4 inches high and 7 inches wide, with at least 16 in a circle, and enough to make a continuous line would be better.

Two or more rows of small tuyeres above this have found advocates, but after use for a short time they are generally abandoned, and as good results are obtained without them.

CHARGES.

The bed of coke must be deep enough to hold the pig iron about 1 foot above the tuyeres when it begins to melt. Enough fuel must be added at each charge to replenish the bed and keep the iron at the melting point. There exist various opinions regarding the size of charges. Some use large charges with as good results as others using smaller ones. It would seem, however, that small charges of fuel at short in-

tervals would replenish the bed more uniformly, and only so much iron can be added as these additions of fuel will melt. In such a cupola as we have described 1700 pounds of coke would be used as a bed. About 4000 pounds of iron would be put on, followed by 300 pounds of coke, which will occupy about 5 inches in depth. This will melt at least 3000 pounds of iron, which will occupy about 9 inches depth. Toward the end, as the cupola becomes hot, the coke charge may be decreased slightly. If a large number of charges are to be made, after the sixteenth the coke may be 275 pounds and the last two charges may be 200 pounds.

RAPID MELTING.

The smaller the amount of fuel used to keep the iron hot the faster will be the melting, for if there be more fuel than is necessary to melt the iron, it must burn away before the next iron can get down to the melting point. If it is found that it is necessary to stop up often, it may be well to try and take 10 pounds of coke from each charge. If that hastens melting and the iron is still hot enough, after a few days take off another 10 pounds, but go very cautiously with any change. The general practice is exactly the opposite. Whatever happens the melter will add more coke and thus make the melting still slower. Breaking the iron in pieces of about 25 pounds causes the iron to melt faster, and uniform charging, so as not to allow the blast to work through faster at one point than at another, is very important.

SLAGGING.

If the heats are less than 16 tons, and especially if the sprues are milled, the slag that will accumulate will be needed to properly protect from the blast the drops of iron as they pass down to the hearth. If the sprues are charged with the sand on, or if the heats are over 20 tons, a slag hole must be provided a little below the tuyeres, and after about 15 tons have been taken out the slag should be tapped.

FLUXES.

To make the slag fluid enough to run out of the slag hole, limestone or fluorspar must be added. The latter is expensive, and, to say the least, gives no better results than limestone. Our experience has led us to consider limestone the best, irrespective of cost.

About 40 pounds to the ton of iron is sufficient. It should be broken a little smaller than an egg. The limestone should be taken from the outcrop or surface of the quarry, and will be white and brittle. That further down is hard and dark colored and makes a thick black slag. When large heats are made, and the cupolas are slagged, it is quite customary to charge sprues with the sand on them.

It is a question whether it is cheaper to melt the sand off or to mill the sprues. In large foundries making from 25 to 30 tons of sprues it is quite a serious matter to mill them, and necessitates two extra handlings. It is then probably better to add lime and flux away the sand.

DULL IRON.

In charging cupolas it is usual to add a few hundred pounds more iron than the molders call for. It is not well to run too close, as when the blast gets through the last charge the iron is likely to be dull. If, unfortunately, the iron runs short, scrap plate must be thrown in at the last end without fuel, and is almost sure to come out dull. If dull iron should occur in the middle of the heat, add a little more fuel next day to the charge that runs dull, though such dull iron generally results from a mistake in charging. It must result from a mistake in weighing the fuel or the iron, or from the iron hanging up, and later on falling down below the melting point. Inferior coke may cause dull iron, but this is a very unusual cause, though the fuel invariably gets the blame.

QUALITY OF THE IRON.

It is generally supposed that the best iron comes down at the first part of the heat, but the reverse is true. As the cupola gets hotter the quality of the iron improves, and any special work, such as patterns, should be poured near the last end, or when about two-thirds through. If a little white iron comes out at first, charge a hundred or two of silvery iron on the bed next day, which will correct the evil. By regulating the mixture properly, the first and last ladle are practically as good as any other ladle of iron for any work.

Following the reading of this interesting address of Mr. Keep's a paper on "Credits and Reports" was read by R. G. Rennolds, which was discussed pretty thoroughly. A committee consisting of W. H. Pfahler, Charles S. Prizer and Grange Sard was appointed to prepare a memorial on the death of Jesse Orr, late president of the association and have it engrossed. The Committee on Stove Terminology made a report recommending a trade name for every separate piece or part of a stove. This led to a very interesting discussion, in which many disputed points were brought up for the opinions of those present. The afternoon session having been prolonged to a very late hour no evening session was held.

THURSDAY MORNING.

(*By Telegraph.*)

The morning session on Thursday surpassed in interest any previous session. It was the time which had been fixed for a presentation to the full convention of the molders' views on an advance in their wages. All manufacturers had been invited to attend, even if they were not members.

The General Executive Committee of the Iron Molders' Union of North America were present, as follows: Martin Fox of Cincinnati, president of the union and chairman of the committee; Martin F. Monahan of Albany, Joshua G. Galloway of Dayton, John Campbell of Quincy and Patrick Enright of Chicago.

They all addressed the members of the convention, presenting the molders' side of the wages question in a very calm and dispassionate manner, and making a series of very strong arguments. They reasoned that the past few years had been a period of great activity and consequent prosperity in the stove trade, but that the molders had had no share in this prosperity. Meanwhile the cost of living had advanced, especially in the West, so that the purchasing power of a dollar is less by 10 to 20 per cent. than it was two or three years since. They further stated that the body of molders whom they represent had been growing more and more dissatisfied with the disposition of the Executive Committee to settle affairs amicably with the manufacturers, claiming that an advance of wages could have been secured before this if active measures had been taken in that direction. They stated that if an advance of wages was not made now it would be impossible to satisfy the men, and that in the interest of peace and harmony the manufacturers should make the concession asked. The demand originally made for an advance of 15 per cent. was modified to 10 in the hope that this might more nearly meet the views of the manufacturers.

Replies to the arguments of the molders were made by Henry Cribben, Grange Sard, W. W. Baldwin, D. McAfee, Uriah Hill, Jr., and C. H. Castle. They deprecated an advance in wages at this time, laying great stress on the unsettled financial condition of the country, the stringency in the money market, the probability of dullness in all classes of trade for some time to come, and the necessity for curtailment of expenses at such a time, rather than making a very great increase in the cost of producing goods. The speeches of the manufacturers were in the main argumentative and conciliatory, only one of them striking a discordant note in a reflection on the motives of the officers of the Molders' Union, which at once aroused expressions of disapproval from the other manufacturers. It was further asserted, and the molders admitted it, that wages could not be raised unless the price of stoves be advanced, but at present this is impossible. The question was then deferred for further consideration to the afternoon session, after which Lazard Kahn read a paper on "Consolidation," which was well received.

THURSDAY AFTERNOON.

The afternoon session met at 3 o'clock. The demand of the molders for an advance was taken under consideration and a resolution was adopted that in the present condition of business generally it was not expedient to make an advance in wages. There was some discussion with regard to promising an advance in case trade improved, but it was considered unbusinesslike, and, therefore, no expression was made on this point.

The next business taken up was the election of officers for the ensuing year, which resulted as follows:

Geo. D. Dana, St. Louis, president.

C. S. Prizer, Reading, first vice-president.

A. M. Blakesley, Rock Island, Ill., second vice-president.

W. S. Stevenson, Philadelphia, treasurer.

An informal secret ballot was taken on the secretary, which developed no opposition to D. M. Thomas, who was then formally elected unanimously.

The Board of Managers chosen was:

H. W. Buttorff, Nashville.

Henry Cribben, Chicago.

C. A. Ducharme, Detroit.

E. W. Peck, Rochester.

W. E. Walker, Taunton.

The salary of the secretary waa increased $1000 for the coming year, A paper on "Traveling Salesmen" was then read, which had been written by Franklin L Shepard of Philadelphia; another by D. McAfee of Quincy on "Credits;" another on "The National Association," by Fred. W. Gardner of Chicago; another paper on "Costs," by D. M. Thomas, was not read, but was ordered printed in the proceedings. The Committee on Communication from Albert A. Pope on good roads reported in hearty sympathy with the movement to secure better roads.

A resolution was adopted to meet in Chicago on the first Monday of May, 1894, after which the convention adjourned.

Immediately afterward the Defense Association held a meeting and approved the action which hsd been taken by the Ntional Association.

Some Trimmings.

— "CLAIM YOUR BAGGAGE AT ROOM 40" was the invitation of the Ireland & Matthews Mfg. Company of Detroit, to inspect a fine show of art work for stove ornamentation. Tile, trimmings, urns and ornaments made a display the elegance of which would have done credit to the World's Fair. The invitation was extended by means of brass baggage checks which were distributed right and left among those in attendance at the convention. On presenting the check the baggage was found to be a souvenir clock in bronze representing a traveler's grip to which was attached a check on which was "always on time" and below this "Ireland & Matthews Mfg. Company, Detroit, Mich." In consequence all had a good "time" at the convention.

— EVERYBODY WAS INVITED to room 38 by E. A. Ireland, who displayed a profusion of the newest things in stove ornaments. Copper, bronze, gilt, nickel and venetian iron work are profusely used with an artistic ingenuity in producing beautiful designs. Some handsome lamps and tables, made from brass and onyx, with colored silk shades and lace covers, contributed further elegance to the room. A convention souvenir presented to all callers was an inkstand with a beautiful onyx base and an elegant brass case and cover for a glass ink well, which could be removed. These favors were distributed from the makers of the goods. The Matthews & Willard Mfg. Company of Waterbury, Conn., who have recently opened a salesroom at 5 Wabash avenue, Chicago, where a line line of goods is shown under the charge of Mr. Ireland.

— H C. MATTHEWS, the pioneer and patriarch of the nickel knob and stove ornament business, from Waterbury, Conn., found a cordial welcome at all hands which was only overshadowed by his own jovial geniality

— JOHN E. GATELY of Troy, N. Y., wore a miniature Alaska poker for a scarf pin and exhibited an empty pocketbook, but was happy, as the doubling of his producing capacity in the past year is only about equal to meeting the demands of the trade for the Alaska stove trimmings. It was not necessary for him to bring a roomful of samples in order to show the stove manufacturers what he makes. The Alaska goods have become almost "a household word" by this time.

— THE RAVEN STOVE POLISH COMPANY of Chicago shone out with conspicuous brilliancy before the members at the Palmer House, a display of samples being made in room 38.

— W. F. GREENE of Troy, N. Y., was very busy doing the convention and saying a few words for the Jewel and Crown stove knobs and trimmings, while spreading good fellowship by introducing the members from distant sections, as they all know him.

— HENRY GLEASON of New York made no elaborate display of art tiles or other trimmings, but was just as cordially welcomed by the members. A stove convention would hardly be a genuine stove convention without the only Gleason. He favored a number of his friends with a pictorial art tile, said to be suggestive of Chicago, but hardly accepted as such by Chicagoans.

— A FIRE on the 28th ult. burned the main facing mill building of the Chicago Foundry & Supply Company of Chicago, with the machinery. It is supposed to have been caused by a spark falling from the pipe of a miller who was dressing a millstone. No inconvenience will result to the trade, as an abundant stock of goods on hand will enable all orders to be filled promptly until new machinery is set in operation in a new building on the old site.

THE EXHIBIT of stoves at the World's Fair came in for a great deal of discussion during the week. It was considered by no means as extensive as it should have been, considering the great industry represented. Everybody appeared, however, to understand the reason, which was that not enough space had been allotted to the exhibitors of stoves. Therefore the best had been done that was possible under the circumstances. The exhibit itself was regarded as highly creditable and thoroughly representative of the wide variety, high character and fine quality of American stoves, fit for the inspection of visitors from abroad.

THE STOVE MANUFACTURERS spent as much time as they could in visiting the World's Fair. The counter attractions of the great show, however, interfered less with the attendance at the sessions than one would have naturally supposed. The members of the stove association feel that their annual mingling with one another is productive of good results in many ways, and have therefore not been inclined to permit other matters to interfere. In view of the fact that the assertion is often made by stove manufacturers and others that the National Association has outlived its usefulness and is in its declining days, it has been refreshing to observe the heartiness with which the work of this convention was conducted. The membership may not be so great as several years since, but that is apparently having no effect on the enthusiasm of those who carry on the work and assume the burden of shaping to a great extent the course of the American stove trade.

THE HOWARD FURNACE COMPANY have recently purchased a city block in the first ward of Syracuse, N. Y., on which they propose erecting in the near future a five-story brick and frame slow-burning factory building. The structure will cover an area 100 feet square. The company will also put up a steel foundry of the same dimensions. We understand it is the intention of the company to erect these buildings during the summer months, and to occupy them some time in December.

Exhibits at the World's Fair.

Heating and Cooking Apparatus.

THE WM. MILLER RANGE & FURNACE COMPANY

of Cincinnati, Ohio, have, in the next block south, a number of Monitor ranges on exhibition in various sizes, from the six-hole range for private use to the double range for hotels or restaurants. A range suitable for restaurant use is shown, having eight holes for cooking, central fire place, two large baking and warming ovens, &c. A double range for hotel use is a conspicuous feature, illustrating the manner in which two or more ranges can be connected, each having its own fire place, water back, &c. A steam table is presented which is richly ornamented with nickel-plated trimmings. This firm also make a variety of coffee and tea urns, using steam, gas, oil or gasoline for heating, as may be desired. One of these urns, handsomely finished in nickel plate, is among the exhibits, which are inclosed by an old copper railing of unique design.

THE CORTLAND HOWE VENTILATING STOVE COMPANY

of Cortland, N. Y., who come next, have an ornamented pavilion, the roof of which is covered with striped cloth, while the sides are draped in white and yellow. Nickel-plated rails with neat wooden posts surround the carpeted interior. A great variety of the ventilating stoves are shown, some having nickel-plated trimmings only, while others are entirely covered with nickel plate. One stove is mounted on a wooden base and so arranged as to show the manner in which it can be connected with the outside by means of a pipe leading under the floor, thus supplying the interior with an abundance of fresh air.

SMITH & ANTHONY STOVE COMPANY

of Boston, Mass., have their exhibit inclosed by an iron railing, painted white, with gilded stripes. The Hub heaters, for steam and hot water, are shown in various sizes, from the No. 118 to No. 130. The iron work of the heaters is painted white with gilt letters, the casings being of ribbed galvanized iron. Samples of the Hub combination heaters, for hot water and warm air and for warm air alone, are also shown. Passing across the aisle.

CRIBBEN, SEXTON & CO.

of Chicago have one of the most ornamental pavilions in the building. The supporting pillars and cornice are finished in oxidized silver and gilt, while the interior is in linerusta walton. Large French-plate mirrors cover the rear of the exhibit space. Under the central dome, which is provided with numerous electric lights, is suspended a large globe, which indicates the "universal" distribution of the firm's goods. Among the heating stoves on exhibition can be mentioned the Reliant Universal, shown in full nickel plate and in black with nickel-plated trimmings, having reflector top, duplex grate and circulating tube through the stove. The Universal Oak, for coal or wood, is made in six sizes, with ash pan and draw center grate, so arranged that the openings in grate can be opened or closed tightly as may be desired, thus affording an air-tight stove if re

quired. The Ideal Universal base heater is designed for wood, with return flue or with direct draft. Among the ranges shown are the Regal Universal of new design, made in four sizes, with draw-center grate, oval fire box, for hard or soft coal, water front or reservoir, high closet, large oven, &c.; the Pacific Universal, for wood, made in three sizes, with square top and reservoir; the Imperial Universal cook, for coal, made in three sizes, square top, reservoir and closet, and the Prize Universal cook, a square stove with reservoir or reservoir and closet.

THE FULLER-WARREN COMPANY

of Milwaukee and Chicago are preparing an attractive place for their exhibit. The floor is of polished oak, with an ornamental border, while the walls are finished in cream and gilt. No stoves were in place at the time of the writer's visit.

BUCK'S STOVE & RANGE COMPANY

of St. Louis, Mo., will have an exceedingly fine exhibit. The floor is of hard wood, and two sides of the space are inclosed with an ornamental railing. In the rear of the exhibit space are three recesses above which is an ornamental cornice. In the recess to the left is an old-fashioned smoke stained fire place provided with crane and hanging pot, illustrating the method of cooking in the bygone days of 1776. In the recess to the right is placed an ancient cooking stove and accompanying chimney, illustrating the manner of cooking in 1816, at which time the company began business. In the central recess, which has an ornamental tile floor and wainscoting, is placed a modern range of the company's manufacture in all its glory of burnished nickel, thus representing the present method of cooking. The remainder of the exhibit was not in position.

CO-OPERATIVE FOUNDRY COMPANY

of Rochester, N. Y., have a handsome booth, which is painted a light color with gilt decorations. The firm's name and location, in raised gold letters on a background of black, are placed on the cornice on the four sides. Above the cornice on two sides is the "Red Cross" in red and gold, supported by ornamental iron work, also in gold.

The floor is carpeted and the exterior is surrounded with a brass railing. A series of Red Cross ranges in three sizes is presented. A 9-23 is shown in full nickel plate and partly burnished. This range has a high warming closet and low water reservoir. An 8-21 range, for wood, is in black with nickel-plated trimmings. A copper water boiler is attached to this range, showing the manner of connecting the water front with boiler. An 8 19 of the same series is presented in full nickel plate, partly burnished. Samples of the Red Cross Talisman, for wood, are shown, with full nickel plate, and in black with nickel-plated trimmings. The Red Cross Herald, for wood or coal, is of new design, and made in 16 styles. This range has large square oven, flush reservoir, duplex grate, and water front if desired. A sample of Monroe range is also shown, which is particularly adapted for hard coal. This range is made in 30 styles and sizes. Another sample is the Standard Red Cross range, which is made in eight styles and sizes. The Red Cross Champion Cook, a sample of which is shown in black, is made in 24 styles and sizes. Among the heating stoves for coal are the Red Cross A, made in three sizes; Royal Red Cross, made in three sizes; Red Cross B, two sizes, and Red Cross Signal, made in five sizes; the Red Cross Oak for coal or wood, made in four sizes, the sample being in black with nickel-plated trimmings. A Sylvan Red Cross cottage, for wood, is shown, which is handsomely nickel plated. This stove is made in six sizes—three with direct draft and three with syphon flue. While only one box stove is on exhibition it attracts considerable attention. It is of cast iron, 26 inches long, 15 inches wide, 16½ inches high, is cast in two pieces, weight 410 pounds and was made in 1796. This stove was used by John Post, a merchant of Utica, N. Y. The

GORTON & LIDGERWOOD COMPANY

of New York, Boston and Chicago show but a single specimen of their Gorton boiler for steam and hot-water heating. It is a steel sectional tubular boiler, with automatic feed, having four openings for feeding the magazine. This boiler is decorated in white and gold and is very attractive in appearance. It is equipped with steam gauge, try cocks, draft regulator, &c. Immediately adjoining this is an interesting exhibit by the

MILWAUKEE TACK & NAIL COMPANY

of Milwaukee, Wis., showing Buzza cott's ingenious invention for camp and outdoor cookery, as used by the United States army for field and camp service. The outfit embraces ovens, boilers, kettles, stew pans, &c. A special feature of the apparatus is the arrangement for an interior fire place for burning fuel in wintry weather. The

WILCOX WATER HEATER COMPANY

of Chicago show one of their combined kitchen ranges and water heaters. The system on which this is constructed has been described in our columns. Briefly, a heavy cast range, with a circular top and the usual cooking holes, has a cylindrical top placed toward the rear, containing coils of pipe, through which heat passes from the fire box of the range, the outlet to the chimney being through the cylinder. The coils are separated by baffle plates to more completely conserve the heat from the products of combustion. The

AMERICAN HEATING COMPANY

of Rockford, Ill., exhibit a sample of their American heater and hot-water circulator. It is of rectangular form, with circulating tubes placed in a horizontal position over the fire box. These tubes are double, the return water flowing in the inside tube and the heated water passing back in the outside tube to a chamber in the rear, with outlets at the top. The

SUPERIOR FURNACE COMPANY

of Little Falls, N. Y., show a No. 62 Superior warm air furnace and a Superior wrought range. The furnace is only partly jacketed, enabling its interior construction to be inspected. The cast-iron front of this furnace is a fine piece of molding, but it has further been completely electro-bronzed, giving it a decidedly handsome finish. The range shown is a six-hole construction, with high warming closet, hot-water tank on side brackets, with trimmings in electro-bronze and nickel.

ABENDROTH BROTHERS

of New York City come next with an exceedingly handsome display of heating and cooking apparatus. Two oak mantels are arranged at a right angle in the center of the space. One is fitted with the York Grand and the other with the York Queen fire-place heater, with tiled hearth. On the mantels are a number of artistic vases. Above the mantels is placed the Abendroth trade-mark in gold, white and blue. In front is the York six-hole range, No. 70. On the left are the Uncle Sam six-hole range, with high full-nickeled shelf; the York six-hole, No. 88, with high nickeled shelf, and the Andrus water heater. In the rear are the Lynwood six-hole range and the Pride of America ten-hole range. On the right are the Norfolk six hole range; the Bridge five hole range, with its combination of stove lid and pipe collar for use over any cooking hole, and the York warm-air furnace B. The arrangement of this exhibit is worthy of high praise, both for the character of the goods and the manner in which they have been placed.

THOMAS, ROBERTS, STEVENSON COMPANY

of Philadelphia are next in order, with a number of their high class ranges, embracing the Home Fortune eight-hole double oven; the Active Fortune six-hole, with horizontal hot-water boiler; the Active Fortune five hole, with horizontal boiler; the French Fortune double oven, with horizontal boiler, and the Gauze Door range (Filley's patent), six hole, with horizontal boiler. They also show the Challenge Syphon furnace, which is so constructed that the air to be warmed is deflected by interior plates so that it is compelled to come in contact with the dome of the furnace and thus become more highly heated. The exhibit is a fine one, and it enjoys a conspicuous position at the intersection of two aisles. The horizontal boilers over the ranges attract particular attention, being rarely seen in the West.

THE FARQUHAR'S HEATING COMPANY

of Chicago show a No. 32 Low-Down Surface Burning Hot-Air furnace, a No. 6 Seamless Air-Warmer, which is also a combination hot-water heater, and a No. 5 Circulating Tube Water Heater. The Seamless furnace represents their most perfect form of combustion chamber for soft coal, a thermostat governs air valves, which permit air to enter under the grate and also through a channel in the fire-brick dome which arches over, leaving a long, narrow exit from the fire chamber for the burning gases. The admission of air through the hot bricks promotes a combustion which sends no visible smoke from the top of the chimney and keeps the brick in a continual incandescent state. Another feature claimed for this furnace is the impossibility for smoke, gas or dust to escape to the air chamber.

THE SPICER STOVE COMPANY,

Providence, R. I., show a Model Grand range with an elevated hot closet and a Prize Model range with a high shelf that has a nickel-plated art casting for a center piece. The Art Model is a round full reversible flue surface burner with a Russia iron body, making a rich contrast to the cast work and the bronze and nickeled decoration. The Model Grand has exactly the same qualities, but is square in shape, presenting a rather unique beauty. All of these stoves have an oven in the top with a cover in two parts, but so arranged that moving either open both.

F. AND L. KAHN & BROS.

of Hamilton, Ohio, make a novel and attractive exhibit in a small space. In the center is an "Old World" heating

stove, forming the pedestal for a figure which is really a suit of armor that on examination might have been cast in their foundry. From the back of this figure a smoke pipe makes its appearance and runs up to a cap that closely resembles a crown. Pipes run from the stove through the legs of the figure to a drum in the body, which connects with the smoke pipe. Surrounding and fit company for this "antique novelty" are the Floral Estate, a handsome open stove ornamented with gilt bronze trimmings and tile; the Scientific gas radiator, of nickeled castings, Russia iron columns and glass ornaments; the Peerless Estate gas range, with water back; the Real Estate coal cook, with their patent knife-sharpening edge, and the Estate oak, in three styles of finish, with one of their jointless ash pits as a conspicuous feature at the front of the exhibit.

(*To be continued.*)

Report of Gas Commission.

We have received a copy of the report to the Western Pennsylvania Exposition Society of the Natural Gas Commission appointed by them at the request of the natural gas companies of Pittsburgh. These companies wished to ascertain, for the benefit of their customers, the most economical and perfect gas appliances of those competing at their exposition in 1892. The report is a pamphlet of 28 pages in text and 13 extensive pages of test records. From the pamphlet it is learned that a first and second prize were offered for cooking stoves, for which there were seven competitors; a prize for hot-air furnaces, with three competitors; a prize for heating stoves, with ten competitors, and a sweepstake prize. The commission state: "After consideration of the character of the entries we determined that in addition to economy in the use of gas we would also take into consideration the question of ventilation by the stove, principally as to the discharge of the unhealthy vapors and gases resulting from combustion. We did not decide this latter as conservators of the public health, but because we believed that any appliance that did not provide for and would not discharge the products of combustion from the stove into the open air outside of the room did not deserve an indorsement which would commend it to the public. That some appliances which had no means of getting rid of the products of combustion were submitted to us to be tested shows that a difference of opinion exists on this point, but the science of ventilation and the laws of hygiene, as well as our own physical experience while making the tests, demonstrated satisfactorily to us that our conclusions in fixing the points were correct."

Contestants were invited to be present during all tests and all records were open to their inspection. The tests were all conducted in a building erected for the purpose in the southern corner of Machinery Hall. It was 19½ feet long, 14½ feet wide and 12 feet high, with double doors 6 feet square in one end and a window in each side 4 feet 4 inches by 2 feet 4 inches in size. It was afterward found necessary to cut a hole 2 feet in diameter in the ceiling in the center. Natural gas was the fuel used in all tests and the pressure regulated to a degree most advantageous to each particular appliance by a Stott Regulator and determined by a water gauge close to the appliance. One of the American Gas Company's meters, after being tested carefully, was used to measure the gas used, and was graduated to be read to one-hundredths of a foot. Two air meters were used for measuring the velocity of the gases as they passed to the chimney and of the air currents at stated points. Ten thermometers were hung at different places in the room besides those used directly in the stoves. A mercury column barometer registered the condition of the atmosphere, and the room was lighted by three incandescent electric lights. A long description follows of the specially-made apparatus used for various purposes, which shows that the tests were made with great care and were very exhaustive. A water-fed device was used "to see how much vapor of water could be condensed from the products of combustion resulting from the consumption of a given amount of hydrogen gas." In testing, the amount of heat units that would be absorbed by a given quantity of water was used as giving simpler and more accurate information for comparison than could be gained from roasting or similar experiments. A description of the constructive features of the apparatus tested is given and an explanation of the method of determining the velocity of currents of air and products of combustion, of the amount of heat utilized and lost, of the effect on the general temperature and the effect on the atmosphere. The tables show the record of each test and enable a comparison. The book is valuable not only for the information it contains, but also as a guide for those wishing to make similar trials, giving a clear idea of the amount of labor involved and the great care necessary to make a test sufficiently correct to be worthy of record. From the fact that the tests were so carefully made, it is unfortunate that there was so small a representation of the many gas appliances made.

E. Bement & Sons

of Lansing, Mich., have a plant covering seven acres, the floor space inclosed amounting to 200,200 square feet, or about five acres. Their stove foundry is 640 feet long by 60½ feet wide, including new buildings just finished, 119½ feet long. They have molding rooms now for 108 molders. The ground floor of the new part is used for molding, and the second and third stories for mounting, being three stories high. A new stove warehouse has also been added, which is 140 x 51 feet, four stories high. The ground floor is used for shipping and the other floors for storage. The cupola capacity of the foundry is 18 tons per day. All these buildings are of brick and are lighted by electricity. An overhead railway track is being built the full length of the foundry for carrying metal and castings. The track and carrier are of the firm's design, and it will eventually be operated by electricity. A novel device for ventilating the tumbling or scouring room, and mounting, buffing and grinding rooms has been put in. It is operated by suction, which carries the dust from the machines down below the floor, the lighter particles going up the smoke stack while the heavy portion is flushed into the river running past the works. The firm are bringing out a new line of medium-priced cooks and ranges, to be put on the market under the name of Villa; also, among new goods, two smaller sizes of the Palace oak, 10 and 12 inch, sometimes called bedroom oaks. Their line of Palace Regal and Palace Grand base-burners will be redressed and improved in ornamentation. For the purpose of getting the best results in all departments necessary to turning out high-class work, they are putting in their own nickel-plating plant with all modern improvements.

ODD PLATES.

Chas. J. Ridgway of Ridgway Furnace Company has just returned from an extended trip in the Middle and Western States in the interest of the New Ridgway revolving open fire pot furnace, which is shown to the trade with many improvements for 1893. Besides securing additional space for their exhibit at the World's Fair, Mr. Ridgway succeeded in making a number of valuable agencies for the sale of the furnace, which is, we are advised, taking very well with both trade and consumers.

The Sidney Hollow Ware Company have recently been purchased by Philip Smith, who, we understand, will at once increase the productive capacity of the plant and confine the output to the finest grade of hollow ware.

Walker & Pratt Mfg. Company, Boston, Mass., are showing a neat range called New World, and if any of the out of town trade are in the vicinity of Union street it will be well for them to drop in and hear A. W. Walker hold forth on the beauty and utility of this range. The visitor may be reminded of that most excellent old story of the panorama in which the words, "Turn the crank, Mike," appear with pertinent frequency. The auditor will go away impressed with Mr. Walker's eloquence and a more or less confused idea of new processes of manufacture, revolutions in the trade, patent dampers, improved ovens, artistic effects, low price, excellence in construction, &c. The new range has a handsome bronze plate representing the landing of Columbus, with the Indians somewhere out of sight, but the well known colloquy wherein Columbus is reported as saying "How are you, Indians?" and the Indians answering, "How are you, Columbus?" and Columbus saying, "You are discovered," and the Indians replying, "We are," is left to the imagination. Aside from the beauty of the plate there is, according to Mr. Walker, this significance, that the advent of the new range marks an epoch in stove trade history to be compared with the discovery of America. Besides the New World range, Walker & Pratt Mfg. Company are preparing two larger sizes of their line of Equator furnaces, which will make six in all. The new sizes have 28 and 32 inch pot respectively, and will be ready by the middle of the summer.

The Chicago & Erie Stove Company of Erie, Pa., have brought out a new stove which is called the Patent Modern Helper. In shape it is similar to a steel range, but much heavier than an ordinary cast range, the makers having combined many of the advantages of both the cast and steel constructions in this four-hole range. The bottom oven plate is made of steel supported by automatic adjustable patent braces, which have been so successfully employed in connection with the company's goods. The Modern Helper is provided with heavy, strong castings, large flues, end broiling door, which can also be used as a feed door, if desired, and high closet or shelf. Special reference is made to the arrangement of the oven plates and to the drop door,

which is well balanced and similar to those used on the company's steel ranges. It is said to be easily handled and when let down forms a convenient shelf. The patent bottom of the oven is so thin that it heats rapidly, thus giving a quick oven. The Peerless Helper is a comparatively new construction and embodies those features which are essential to first-class construction and operation. The company are distributing a circular which gives the selling points or reasons why dealers should secure lines of these ranges. The remarks cover numerous points, among them being the patent steel oven plate in the four-hole ranges, which is said to have more than 90 parts and pieces as braces and supports under it. The Modern Helper line is intended for using coal as a fuel and the Peerless Helper is made for wood only.

PATRICK G. BREEN, one of the best-known foundrymen in the West, died at his home in Detroit, Mich., on the evening of Friday, May 19, aged 43 years. Mr. Breen went to Detroit in 1869, and was for a time in the employ of the Detroit Stove Works in the capacity of expert molder. In 1871, when the Michigan Stove Company were organized, he was one of their first employees. A short time later he became foreman of the foundry department, and was subsequently advanced to the position of assistant general superintendent. In 1889 he took an interest in the Peninsular Stove Company and assumed the general supervision of the manufacturing department as superintendent, where he continued until about two years ago, when he was compelled to practically give up business on account of failing health.

SAMUEL V. REEVES, who for several years has been connected with the Liebrandt & McDowell Stove Company of Philadelphia, is now to be found at 45 North Second street in that city, where, under the name and style of Reeves & Horner, will be represented the March-Brownback Stove Company, for the sale of their Globe and Crown stoves. The new concern will also represent G. M. Clark & Co. of Chicago, for the sale of their Jewel gas and gasoline stoves, and the Dangler Stove & Mfg. Company, for their Excelsior gasoline stoves. In addition the firm will handle a fine line of oil stoves, refrigerators and other goods, and will carry in stock parts for repair of all kinds of stoves. A leading feature of the business will be repairs for gas, gasoline and oil stoves. With an intimate knowledge of the business and the trade, the new firm should command a good patronage.

MR. MCDOWELL of the Liebrandt & McDowell Stove Company, Philadelphia, has been confined to his house for some time through illness. He is now recovering and expects to resume business next week.

CHARLES ELLIOTT COLEMAN, representing Eugene Munsell & Co., 218 Water street, New York, has just distributed among the trade his fifth annual souvenir, consisting of a pretty folder tied with a pink silk ribbon. The front cover carries a faithful likeness of Mr. Coleman, while the second page is embellished with an ornamental design across which is printed "Season of 1893." The address to his friends is, in substance, a request not to visit the World's Fair, or complete arrangements for their fall line of stoves until Mr. Coleman has called upon them, which will be very soon. The fourth page of the folder is inscribed with the name and address of Munsell & Co. and an indication of the line of goods which they manufacture.

M. HERTENSTEIN & Co. of Columbus, Ohio, are calling the attention of the trade, by means of an illustrated card, to their Gilt Edge oak stove for 1893. This heater is mounted with high grade sheet steel, every joint being made air and gas tight. It is provided with large ash pan, heavy fire pot, draw center grate and nickel trimmings. The fire pot is sectional and can be placed in position without removing the coal grate. The Gilt Edge is made in four sizes, the numbers 12, 14, 16 and 18 indicating the diameter of the fire pot in inches.

THE MICHIGAN STOVE COMPANY send us this week a sample of the poeket mirrors which they are distributing. These mirrors have a highly polished nickel back with the Garland trademark stamped on it, making a very pretty pocket companion.

AT A SPECIAL MEETING of the directors of the Carton Furnace Company, held at Utica, N. Y., S. A. Batty was unanimously elected to fill the vacancy caused by the death of James Jones. Mr. Batty has been connected with the company for the past six years, and his promotion is an evidence of appreciation of his faithful discharge of important duties. His position in the past has been one of trust and responsibility, in which he has shown himself worthy of the confidence placed in him. The directors of the company also elected George Jones superintendent of the works, to succeed his father, James Jones, deceased. Mr. Jones has been in the employ of the company for the past ten years, filling numerous positions of trust with entire satisfaction, and having received a thorough training under the direction of his father, is well qualified to fill the position of superintendent.

THE SUPERIOR FURNACE COMPANY of Little Falls, N. Y., have issued a circular letter bearing date of June 1, to the effect that they have removed their Western branch office and salesroom from 84 to 82 West Washington street, Chicago. This has been done for the purpose of securing more favorable quarters for the proper display of their line of Superior warm-air furnaces, combination heaters and wrought-steel ranges, which it has been impossible to show in their exhibit in the Manufactures Building at the World's Fair. The company have established a bureau of information and hope to be of service and assistance to customers, friends and acquaintances in the trade who visit the World's Fair. The company also state that they now have six styles and 21 sizes of Superior furnaces and heaters, mounted in steel plate, wrought or cast iron, for brick setting or portable form, and adapted for all fuels and climates. They have distributed circulars illustrating some of their leading specialties, together with cards showing upon one side pictures of various buildings at the World's Fair and upon the other advertising matter of interest to the trade.

FAITH, BELSON & Co. of Philadelphia are doing a great business in Moon's Heat Equalizer, an oven for gas, oil or gasoline stoves. Their shipments have been running from 800 to 1000 a week. In opposite direction, the cooling business is equally good. Their orders for the Michigan refrigerator, made by the Belding Mfg. Company, are among the largest the company receive.

THE FULLER & WARREN COMPANY, Troy, N. Y., have just issued a special supplement known as No. 5, for distribution among the trade. Special attention is invited in this supplement to the company's New Splendid base burner, made in three sizes, with double-heating attachment and duplex grate. The stove is referred to as being new, original, unique, attractive and combining not only the good features that have made the Splendid popular in past years, but in addition is equipped with the modern improvements known to the trade. Sectional views show the arrangement of the flue construction, dampers, grate, &c. There is also illustrated the Art Splendid parlor, which has been improved for 1893, and also the Matchless Diamond. The latter has been entirely redressed and is presented with new legs, skirting rails, name plate, upper nickel section and top and swing cover. The two larger sizes are made with double heating attachments. Special Circular No. 6, issued by the same concern, describes the well-known P. P. Stewart heating stoves, manufactured for over half a century by the Fuller & Warren Company.

O. W. SNYDER, president of the Lexington Foundry Company, Lexington, Ky., recently made a brief trip to St. Louis, Chicago, Detroit and Cincinnati, and secured several good-sized orders for the productions of the company. He also effected the sale of shop rights to use the Kelley patent steel oven, referred to in the columns of *The Metal Worker* recently.

ABRAM COX STOVE COMPANY, Philadelphia, are distributing to consumers a neat little 12-page circular, adapted for inclosure in the usual sized commercial envelope, and calling attention to their Novelty Kitchener. The range is illustrated with its various combinations. It is made plain or with water back, with oven on either side, ventilated oven, galvanized or black boiler, oscillating dumping grate, duplex grate, horizontal (concealed) boiler, or vertical (exposed) boiler.

THE DANVILLE STOVE WORKS of Danville, Pa., with New York office at 284 Pearl street, are bringing out this season a number of new patterns, among which may be mentioned a square parlor stove, to be known as the Princess Beaver, of unique and striking design; an elaborate range called the New Queen Beaver, and a four-hole range of neat design known as the New Prince Beaver. The company will also improve their Ideal Beaver parlor stove and the Beaver Franklin for this season's trade. All the new goods, we understand, are nearly ready for shipment. Some time since the company obtained a patent on a heating attachment, the principle of which is to carry heat from the oven of a range to the floor above, this being accomplished by attaching the heating device to the rear of a Beaver range. The company intimate that there have been some infringements on this patent, and they wish it distinctly understood that they will fully protect their rights.

GRAFF & Co. of 208 Water street, New York, and 207 and 209 Lake street, Chicago, Ill., send us a copy of their price-list of furnaces, ranges and heaters. It is an interesting little volume of nearly 50 pages, printed in tinted ink and bound in flexible covers. Attention is invited to the Faultless line of furnaces, made both portable form and for brick work, also the new Hero, an all cast construction, made in several

sizes. Other goods include the company's hot blast tubular furnace, the Oregon, the Monitor, Charles Smith's hot-water boilers for the company's Faultless and Hero furnaces, the Penn Franklin, a very rich fire place stove, the Elegant, another member of this class, the Faultless brick-set range, adapted for use in French flats and small houses, the Columbian, a double oven range, made in portable form and for brick work, and the Elegant, an elevated double oven range with six 8-inch boiler holes. Several pages are devoted to tables giving capacity of pipes and registers, suggestions about setting furnaces and a list of furnaces, ranges and heaters for which repairs can be furnished.

THE DIGHTON FURNACE COMPANY of North Dighton, Mass., are vigorously pushing the sale of their leading specialties, more particularly the Royal Winthrop six-hole range, a circular of which has recently been issued. This circular is in the nature of a supplemental price-list and bears date of June 1. In it the manufacturers state that they have made a number of additions to their Winthrop line, and in the Royal Winthrop they present to the trade the most durable and artistically designed stove ever turned out. The hearth is large and deep to contain a capacious ash pan, and there are clean-out plates at both ends of the range. The direct damper is operated by a handle in front over the oven door, which obviates the necessity of reaching over a boiling kettle to open or close it. The oven door drops down in such a way as to form a large shelf flush with the bottom oven plate, while by means of the makers' patented pedal device the door can be either opened or closed by a slight touch of the foot. The oven is ventilated by introducing fresh air through a wheel in the center of the door and distributing it evenly through the oven. It escapes through the back oven plate into the smoke flue, carrying off impure air and gases. The rail or dress guard with which the Royal Winthrop is fitted is not bolted to the top, but extends along the entire front of the range, being held in place and supported by means of two brackets. These can be taken off or put on at any time by simply turning two small buttons or clasps.

THE DANGLER STOVE & MFG. COMPANY of Cleveland, Ohio, are the assignees of a patent granted May 16 to Henry Ruppel of Cleveland, Ohio, for a hydrocarbon vapor burner. The burner has a ventilated fire ring, within which is a series of cups. A supply tube placed directly above these has openings in the bottom through which the oil flows into the fire ring. The latter and the supply tube are used in connection with two perforated chimneys, a hood, two tubes, and means for holding the several parts together. The object of the improvement is to provide a burner so constructed as to produce an even combustion and an intense blue flame, which is projected upward through the top of the burner, even though the stove to which the device is attached does not stand square.

A HOT AIR FURNACE of novel construction has recently been patented by William H. Rogers of Philadelphia, Pa. The heater consists of inside and outside casings, through the space between which is a pipe which leads from the smoke chamber placed within the inside casing. There is also provided a pipe for discharging air into the top of the outside casing, where it is heated before being carried to the flues leading to the several rooms.

THE MILWAUKEE GAS STOVE COMPANY of 15 and 17 Erie street, Milwaukee, Wis., have recently issued what they call the "Columbian Edition" of their catalogue of Perfection gas stoves. The little volume is a *fac-simile* of the company's regular catalogue, but with pages reduced in size to 2¼ x 3⅝ inches. The front cover carries a picture of the Perfection gas range connected with a hot-water circulating boiler, while to the right is a view of an interior, showing a long procession of waiters bearing dishes of food, which they have apparently just brought from the kitchen. The fourth cover carries in colors a reproduction of the United States Coat of Arms, while above is the word "Columbian" and below is the word "Edition."

BUCK'S STOVE & RANGE COMPANY, St. Louis, are putting on the market a new cast-iron range, on which they have been working for some time past, and which is of handsome design and well made throughout. The high shelf is particularly attractive and will doubtless go far toward making this range a seller. The grate in this range is the same as that in the balance of the company's productions and which has always given general satisfaction. This range, made in 16 styles, is known as Buck's Peerless, for coal, and Buck's Fashion, for wood, the latter also being made in 16 styles. The company are also introducing a new steel range, made with all the latest improvements, circulars of which are being prepared and will shortly be sent to the trade.

AN ILLUSTRATED PRICE-LIST of gasoline stoves, ovens and sheet metal goods reaches us from the A. J. Lindemann & Hoverson Company of Milwaukee, Wis. Within its covers attention is invited to the Star Junior gasoline stoves, Star individual burner and single generator stoves, the Superior Process and the Game oil stove, together with plumbers' furnaces, wall torches, ovens, &c.

THE BRITISH CONSUL-GENERAL in Roumania reports an increasing demand for cooking and heating stoves in that country. One thousand of the former kind were received from Switzerland during the month of March. Such articles are of comparatively recent adoption in Roumania.

A LITTLE WHILE AGO we heralded the publication of a picture of the World's Columbian Exposition which was to bear indirect witness to the Peninsular furnaces, stoves and ranges. We are indebted to the Peninsular Stove Company of Detroit, Mich., for a copy of this artistic work, which will prove a very pretty wall decoration. It is a steel engraving presenting a perspective view of the World's Fair, mounted with a mat in an oak frame, the whole giving a very pleasing effect. The advertisement of the company is very unobtrusive, being merely their trade-mark printed in one corner of the picture.

THE MICHIGAN STOVE COMPANY are distributing to the trade match scratchers for use on walls of rooms, which are decidedly decorative in their design and finish. They were manufactured specially for the company and incidentally advertise Garland stoves and ranges.

A. WEISKITTEL & SON, Baltimore, Md., have just brought out a new and attractive line of ranges known as the Golden Rule. This name constitutes their trade-mark, which was registered in the Patent Office in January last. The Golden Rule ranges are made with three sizes of ovens, namely, 14, 16 and 18 inches, respectively, and are provided with elevated horizontal boilers. The fire boxes are furnished on the right or left hand side, and with or without water backs, as may be preferred. The other features embodied in these constructions are of the latest and most approved type, while the ornamentation is of such a character as to render the stoves pleasing to the eye. The doors of the oven and lower warming closet are embellished with nickel-plated panels carrying medallion tile in circular frames. The varieties in which the Golden Rule is made are such as to meet the usual requirements of the trade, and the company anticipate for them a large sale.

GEORGE H. DIPPO has resigned his position as superintendent of the Eclipse Stove Company of Mansfield, Ohio, to take effect on June 1. Mr. Dippo severs his connection with the company named for the purpose of taking the management of the new plant of the Dippo Mfg. Company at Chagrin Falls, a suburb of Cleveland, Ohio. The new concern will manufacture iron specialties and fine castings.

THE CENTRAL STOVE WORKS, Foster Brothers proprietors, Lehanon, Pa., have nearly completed a new foundry building 60 x 66 feet in size, which will accommodate 25 molders. Later in the season it is expected to enlarge the plant still further in order to provide for increasing business. The company have a number of the latest improved patterns, follow boards, flasks, &c., but do not now see their way clear to commence manufacturing operations before August 1. Improved machinery will be employed, and the plant will be equipped throughout in such a manner as to turn out goods with dispatch. Their stock and mounting departments are in a five-story structure 50 x 70 feet in size, which at present contains some of the machinery the company will use in their new building. The shipping facilities are said to be excellent, and as only skilled workmen will be employed the company expect to do a large business.

THE WESTERN STOVE WORKS of Peoria, Ill., have remodeled their Lake View oak stove and introduced a number of features which they are confident will be well received by the trade. The exterior has been made more ornamental, both in molding and in nickel trimming, adapting it to use in rooms in which high-grade stoves only are wanted. An adjustable damper at the back of the collar controls and regulates the heat, while the draft is governed by a slide at the side, which can be shut air tight. The slide on the base door has been removed, the change thus made having proved advantageous in keeping fire perfectly. The base is square, ash pan very large, and the fret-work jacket is removable for polishing. The New Home square stove made by this company has also been arranged so that the draft is taken in at the side, leaving only one opening at the base.

THE ART STOVE COMPANY of Detroit have just placed upon the market a new wood and coal base heater with direct and revertible flues, and combining many points not heretofore introduced into this class of stove. It has some very desirable automatic arrangements, and the design is of a high order. It is known as the Laurel base heater.

TRADE REPORT.

The Iron Market.

May closed on an exceedingly dull market in Iron and Steel, and a diligent search fails to develop many features of encouragement in the general situation. Buyers are conservative, and sellers discriminate sharply among their customers. The question of freights, the question of labor, the question of crops, the question of finance and the question of success or non-success of the World's Fair, will all have a more or less important bearing on business during the later months of the year. The convention of the Amalgamated Association opens in Pittsburgh June 6, and if arrangements now being made are carried out, the first conference in regard to labor scales between the manufacturers and the representatives of the Amalgamated Association will be held a few days after the above date. There is, however, a fair volume of business extending about 30 days ahead, besides some very important contracts covering not only this year but the year following; but these are chiefly Government work, and shipbuilding, and, therefore, not likely to influence general business, except indirectly. In the Chicago market the lessening of purchases and curtailment of credits are now almost universal. The pressure for money is increasing, and the very conservative policy of the banks here is being felt seriously.

Pig Iron.—Business is extremely dull, consumers being more inclined to secure deliveries on old contracts than to engage in new ventures. For similar reasons furnaces are kept busy in making shipments and for the present have no need to worry about orders, as their product is largely sold, covering a period of three or four months to come. Stocks are not large and the general situation appears to warrant holders in quoting firm prices, notwithstanding the fact already noted that buyers show very little disposition to increase their engagements. An advance of from 25¢ to 50¢ ₱ ton has been made on local and Central Pennsylvania deliveries, and from all appearances it will be maintained unless there is a falling off in consumption or an increase in production, the latter being somewhat of an improbability. General quotations are about as follows, and from 20¢ to 25¢ less for Southern Irons at Harrisburg and intermediately to Baltimore:

American Scotch, No. 1X	$16.00	@ $16.50
American Scotch, No. 2X	15.00	@ 15.50

At Chicago Coke Iron is in fair demand in small lots. Some consumers of Southern Coke have placed season contracts for 1000 to 4000 tons, but local Coke has been comparatively neglected. Nothing special has transpired with regard to Charcoal. Quotations are as follows, cash, f.o.b. Chicago:

Lake Superior Charcoal	$16.50	@ $17.00
Local Coke Foundry, No. 1	13.75	@ 14.25
Local Coke Foundry, No. 2	13.00	@ 13.25
Local Coke Foundry, No. 3	12.75	@ 13.00

Business in Pig Iron has been only moderate during the week in Southern markets, consumers having manifested no disposition to buy for forward delivery and some who for a long time have done so are now refusing to anticipate their wants for more than a month, alleging that they can buy at least as cheap during the summer whenever they need it, and their experience for the last two years has been that they could buy the Iron cheaper when the time came for using it than they had contracted to pay for it. There are so many consumers who have for some time refused to anticipate their wants that their current purchases in the aggregate are now considerable, although none of them are large. A conspicuous feature of the trade is a general application to have deliveries delayed on current contracts. This is especially the case with stove works and car works. Prices of Southern Coke Iron remain the same as a week ago, except that Mottled Iron is scarce and commands the same price as Gray Forge. Charcoal Iron is generally quiet and lower prices prevail, but there have been fair sales of Lake Superior Charcoal Iron. We give revised quotations;

Foundry.

Southern Coke, No. 1	$13.00	@ $13.25
Southern Coke, No. 2	11.50	@ 11.75
Southern Coke, No. 3	11.00	@ 11.25
Ohio Soft Stone Coal, No. 1	16.00	@ 16.25
Ohio Soft Stone Coal, No. 2	15.00	@ 15.25
Lake Superior Coke No. 1	15.00	@ 15.25
Lake Superior Coke No. 2	14.00	@ 14.25
Hanging Rock Charcoal, No. 1	18.50	@ 19.00
Hanging Rock Charcoal, No. 2	17.50	@ 18.00
Tennessee and Alabama Charcoal, No. 1	15.00	@ 15.50
Tennessee and Alabama Charcoal, No. 2	14.00	@ 14.50

Metal Market.

Pig Tin.—There have been no signs the past week of relief from the depression in values brought about by overtrading induced by the proposed duty. To the contrary, depression is more pronounced at present than it has been at any time during the past two months. A week ago 19.30¢ was apparently a very low price. Since then round lots have been sold at 18.90¢ for prompt and near future delivery; also for delivery up to September 1, sellers' option, at the same price, while ordinary jobbing sales were made at as low as 19¢, regular terms.

Copper.—The market has not changed for the better. Prices are softer if anything than they were a week ago, and evidence is wanting of improvement in the demand, for home or export account. On Lake Superior Ingot the popular quotation is 11¢, but a shade less has been named on small lots, while speculative operators offered at as low as 10¾¢ @ 10.85¢ for delivery during the latter part of the year. Dealings have been on a very moderate scale and the demand is slow at the present time.

Pig Lead.—Prices have been gradually moving toward a higher plane under the influence of very steady purchases for consumption and comparatively light offering. Probably 500 tons have been placed at 3⅞¢ @ 3.92½¢ for round lots and 3.95¢ for single carloads. The latter price was an inside one at the close, while 4¢ was generally asked.

Spelter.—No change has taken place in the condition of the market for this metal. Prices have therefore barely held their own, at 4.20¢ @ 4¼¢, for prompt and near future shipments.

Antimony.—The demand has continued unimportant and prices remain almost stationary. Current quotations are 9.90¢ @ 10¢ for Hallett's, 10¼¢ @ 10½¢ for L.X., and 10½¢ for Cookson's, in wholesale lots.

Tin Plates.—Dealings have been on a rather small scale, and there is no improvement in the demand for prompt or future deliveries. Prices are rather soft, but without radical change.

Coal.

The Anthracite Coal trade is just now bracing up and getting into position for the season. The meeting of Wednesday this week is expected to have some bearing on the subject, but, as a matter of fact, the anticipated benefits are already realized in good measure by the excited inquiry on the part of consumers and the approach made to the actual schedule, which in any event is likely to be adhered to for the present, even though the movement be preliminary to shading at a later day. The immediate effect on the market is a relapse, at least so it may be inferred, reasoning from the usual operation of cause and effect. Operators are sure of one point gained through temporary activity and firmer prices.

The production of Coal last week by the several companies, who endeavor to act in concert so far as practicable, was 856,700 tons, which is about the same amount as shipped from the mines last year.

Chicago Report.

Scrap.—There is very little movement. Dealers quote buying prices as follows:

	Per net ton.	Per lb
No. 1 Wrought Scrap	$12.00	....
Machinery Cast	9.00	....
Malleable Cast	7.00	....
Stove Plate (free of burnt)	6.50	....
Burnt Iron and Grate Bars	4.00	....
Sheet Iron and Hoops	3.00	....
Plow Steel and Breaking Stock	8.00	....
No. 2, such as Shovels, Hoes, &c.	4.50	....
Old Boilers—whole (Iron)	7.00	....
" " (Iron)—cut in single Sheets and Rings	10.00	....
Old Gas-Pipe and Boiler Tubes	7 50	....
Cast Borings	4 00	....
Turnings	5.50	....
Horseshoes	2 00	....
Copper Bottoms	....	8 ¢
Copper Clips and Heavy	....	9 ¢
Heavy Brass	....	8 ¢
Light Brass	....	4 ¢
Pipe Lead	....	3 ¢
Tea Lead	....	2¾¢
Zinc	....	3 ¢
Rubber	....	2¾¢

Anthracite.—An advance of 25¢ ₹ ton has been made, begining with June 1. Quotations on carload lots of 12 net tons are low as follows:

	Grate.	Egg, Sto. and Ch.
Chicago, Ill	$5.60	$5.85
Milwaukee, Wis	5.60	5 85
Kansas City, Mo	8 80	9 05
Council Bluffs, Iowa	8.80	9.35
Lincoln, Neb	8.95	9 20
Sioux City, Iowa	8.80	9.05
Aberdeen, S. Dak	8.85	9.10
Dubuque, Iowa	6.90	7.15
Madison, Wis	7.10	7.35
St. Paul, Minn	8 10	8.35
Burlington, Iowa	7.10	7.35
Des Moines, Iowa	8.55	8.80
Davenport, Iowa	6.90	7.15
St. Joseph, Mo	8.80	9.05
Leavenworth, Kan	8.80	9.05
Omaha, Neb	8.80	9 05

Colorado Anthracite.

COLORADO FUEL & IRON COMPANY.

Denver	$8.00
Pueblo	8.00
Colorado Springs	8.00
Leadville	8.00
Cheyenne, Wyo	10.00
All points between Denver and Missouri River	9.35

WILLIAM VOGEL & BROTHERS, Brooklyn, N. Y., are about offering the trade the Henis Fruit and Vegetable Press and Potato Masher. This device, it is said, is made in such a way that it extracts every drop of moisture from fruits, and potatoes may be put in with their jackets on and with one stroke of the plunger separated into fine particles. It is pointed out that owing to the perfect fit of the plunger no particles are allowed to escape, and the leverage is such as to render the most powerful pressure without overexertion on the part of the operator. The frame is of heavily tinned iron and the plunger and body of tinned steel plate.

LYON, CONKLIN & Co., Baltimore, Md., are in receipt of some very flattering letters relating to their Tin Plates. One of recent date, which is reproduced in their announcement elsewhere, speaks in the highest terms of their Altamont Extra IC Charcoal Plate. The writer says it is the best he has "used for 50 years."

CONDITION OF THE

Hardware Trade.

THE ADVANCE of the season and the general prevalence of good weather have the effect of stimulating business somewhat, and jobbers in many parts of the country, while not doing an especially heavy business, are fairly occupied. The demand, however, is not up to their expectations. Buyers are evidently pursuing the careful policy of purchasing only for early requirements, and the difficulty which is experienced in making collections and the condition of the money market tend to diminish the volume of business, making merchants very conservative in placing orders. Retail business throughout the country is, however, in good condition and an enormous amount of goods are going constantly into consumption. Stocks in retailers' hands, and also with some of the jobbers, are regarded as exceptionally light. There is little to note in regard to the tone of the market in the matter of prices. No improvement is noticeable and in some lines there are indications of weakness. Collections are somewhat better than they have been, but there is still a good deal of complaint in regard to them.

Advices from Chicago.—The Shelf Hardware trade is steadily improving. Orders are more numerous, and jobbers are again feeling in better spirits, although they are of the opinion now that they will not make up the trade they have lost and that there will be a poor year on the whole. The demand for seasonable goods is the special feature. Staple goods are not moving very freely. Builders' Hardware is only moderately active. Very little benefit has so far been felt from the opening of the World's Fair. Visitors are coming here from further West, as was expected, and they are calling to see the jobbing houses whose goods they may have handled for years without seeing any other than traveling representatives, but when they call it is for social purposes, and not to place orders to any extent. Prices are steady, except Wire Cloth, which has been put up to 2 cents all around, with very light stocks on hand. Collections are not improving, as farmers are reported to be too busy in the fields to pay merchants what they owe them. Heavy Hardware has done well this month, but the prospects for June are not bright, as manufacturing consumers report their trade falling off in consequence of the tightness of the money market.

Notes on Prices.

Cut Nails.—The Cut-Nail market is in an unsatisfactory condition as viewed from the manufacturers' standpoint. The demand is moderate and shows no sign of increase, and at the same time there has been a weakening in prices, which are now represented in the East by the quotation of $1.05 for carload lots at mill. Rumors are current also that this figure has been slightly shaded. Some concessions in price have also been made in the West, but in that section the market is regarded as in a better condition than in the East. Small lots from store in New York are held at $1.35 to $1.40.

Advices from Chicago.—Some activity was stirred up in the Steel Cut-Nail trade by the efforts of outside manufacturers to capture business here. Their inducements may have caused concessions to be made by local manufacturers when in direct competition, but on regular business the price of $1.25 on factory lots is maintained. Generally speaking, this branch of trade is rather quiet. Jobbers quote small lots from stock $1.35.

Wire Nails.—The condition of the Wire Nail market referred to in our last issue continues, with a further weakening in tone. The price is now fairly represented by the quotation of $1.45 for carload lots at mill, but intimations are made that this figure has been more or less freely shaded. The volume of business is fair but not heavy, a good many of the large buyers having still a stock of Nails purchased at former figures on hand.

Advices from Chicago.—Inquiries for Wire Nails have improved, and some buyers ask for prices on deliveries running into the fall months. Manufacturers are, however, not generally quoting for delivery after July 1, when they expect a general shut down. Some concerns are accumulating stock in anticipation of that event, so that they can supply their trade. Others, however, are trying to move their stocks, evidently preferring to have the cash in hand rather than in goods, for which there may or may not be a demand. Regular price on factory lots is still $1.50 Chicago. Jobbers report but a moderate demand at present, with small lots quoted at $1.65 to $1.70, with concessions to best buyers, while carloads are selling at $1.55.

Barb Wire.—Barb Wire continues to be quoted at $2.45 to $2.50 for Four-Point Galvanized in carload lots at mill. The demand is moderate but prices are in general regularly maintained. Small lots delivered in New York are quoted at $2.70 for Galvanized and $2.30 for Painted.

Advices from Chicago.—Barb Wire manufacturers report their business considerably better, going so far as to characterize it as satisfactory. Buyers seem to think that prices ought to be lowered, but so far have apparently made no impression on sellers, who continue to quote carload lots of Painted at $2.20, and Galvanized at $2.60. Small lots from stock are held at $2.30 and $2.70 respectively.

The Christy Knife Company.—The following is the price-list of the Christy Knife Company, Fremont, Ohio, terms, net 30 days, 1 per cent. discount 10 days:

	Per dozen.
Christy Knives (Bread, Cake and Paring. Set. No. 1)	$6.00
Christy Knives (Bread, Cake and Paring. Set No. 2)	6.00
Christy Table Knives (set of six Knives)	6.00
Christy Bread Knife	3.00
Christy Cake Knife	2.00
Christy Carving Knife	3.00
Christy Paring Knife	1.00
Christy Meat Saw	3.00

Mrs. Potts' Sad Irons.—As announced in our last issue, the Enterprise Mfg. Company, Philadelphia, have withdrawn their former list prices, terms, conditions, &c. on Mrs. Potts' Sad Irons. The following net prices of the goods are now announced:

No.	In lots of 25 dozen sets at one shipment.	In lots of less than 25 dozen sets.
50, per set	$0.78	$0.86
55, "	.73	.81
60, "	.90	.98
65, "	.82	.90
550, (containing No. 82, 90, and Set. No. 50 Irons)	2.35	2.50
555, (containing No. 87, 95 and Set No. 55, Irons)	2.20	2.35

Handles in lots of 25 dozen are sold at $1.30, and in lots of less than 25 dozen at $1.50. The lots of 25 dozen sets of Irons may be assorted, if desired, as follows: Nos. 50, 55, 60, 65 and outfits 550 or 555, each outfit (No. 550 or 555) counting as one set.

Rivets.—The American Screw Company, Providence, R. I., and Atlas Tack Corporation, 508 Sears Building, Boston, issue circulars giving revised quotations on second quality Rivets. The American Screw Company continue to quote their Norway Iron Rivets at discount 60 and 10 per cent., but name 70 per cent. discount on Bay State Rivets if ordered in quantities to warrant their manufacture. Similar quotations are announced by the Atlas Tack Corporation, as follows:

Norway Iron Rivets.

	Per cent.
Belt, with Burrs, Bettina brand, coppered, tinned or black	50 and 5
All other kinds and Burrs	60 and 10
Second Quality Rivets.	
If ordered in quantities to warrant their manufacture — Class B brand	70

Trade Notes.

J. VAN WORMER & Co., Albany, N. Y., in an announcement elsewhere, direct attention to the Ideal Astral, which they describe as the leader in four hole ranges. It is referred to as of the very latest style of pattern, with fire box, oven, reservoir and ash pan all extra large. Various other particulars are given in the announcement.

THE RAYMOND & CAMPBELL MFG. COMPANY, Middletown, Pa., present an entertaining dialogue in their advertisement this week. It is a conversation between themselves and the universal trade, in which they make many interesting references to the Sun Steam and Hot-Water Boilers, and refer to an exhibit which they are to have at the convention of the Master Steam and Hot Water Fitters' Association, in the Revere House, Chicago, from June 5 to 10.

AMONG recently authorized corporations in Illinois are the following: The Continental Gas Company, at Chicago; capital stock, $10,000,000; for the manufacture of gas, oxygen, oxygen gas, electricity and any and all means or agencies for the furnishing, production or distribution of light, heat, power or fuel, for any and all purposes, in the city of Chicago or such other place or places in the State of Illinois, the United States, or any foreign country as the board of directors may elect; also, to deal in and operate the plants, property, good will, rights and franchises of other corporations organized for the same purpose, and to deal in patent rights; incorporators, Charles Springer, Ernest B. Stuart and Charles S. Corning. The Underwriters' Fire Sprinkler Company, at Chicago; capital stock, $100,000; for the manufacture of automatic sprinklers and appliances; incorporators, O. Pierce, A. H. Dwight and W. E. Dwight. The Champion Flue Scraper Company, at Peoria; capital stock, $7500; for manufacturing; incorporators, Fred. Gauger, Veitus Radspinner and Charles J. Miller. The Cass Electric Company, at Chicago; capital stock, $50,000; for the manufacture of electrical supplies; incorporators, Millard Cass, A. A. Ollendorf and Carl Landau. Columbian Railway Supply Company, at Chicago; capital stock, $10,000; for the manufacture of railway and steamship supplies; incorporators, Roswell H. Mason, George M. Trowbridge and William B. McIntyre. The Progress Novelty Mfg. Company, at Chicago; capital stock, $25,000; for the manufacture of store fixtures and novelties; incorporators, Henry T. Van Denbergh, J. E. Nelson and G. W. Van Denbergh. The Deforest Bicycle & Mfg. Company, at Chicago; capital stock, $200,000; for the manufacture of bicycles, vehicles and toys; incorporators, George H. Welton, A. F. Dreutzer and Charles G. Quelton. The Chicago Flax Packing Company, at Chicago; capital stock, $25,000; for the manufacture of packing and engineers' supplies; incorporators, Harry N. Anderson, Charles R. Holden and Alfred S. Austrian. The Kunzer Smoke Preventor Company, at Chicago; capital stock, $20,000; for the manufacture of smoke preventing and consuming devices and to conduct a machine shop and foundry; incorporators, Mr. Kunzer, Louis J. Hammel and Geo. W. Warvelle.

THE PLUMBING TRADE will be interested in the announcement of the L. Wolff Mfg. Company, Chicago, who present illustrations of Doherty Self-Closing Work. The Western branch of the company is at Denver, Col.

THE CINCINNATI TIN PLATING COMPANY, organized to do a general manufacturing business in metals, tinning, galvanizing and japanning, have been incorporated by Daniel Schoonmaker, Geo. Morris, Jesse W. Kittering, S. M. Blackburn and Howard Douglass, with capital stock $10,000.

A DESIRABLE NOVELTY IN ADVERTISING is shown in the half-page announcement of the E. J. Manville Machine Company in this issue. It is a cut of a Wire-Forming Machine, surrounded by a large variety of formed Wire, showing some of the sizes and shapes the machine will turn out automatically.

THE MOORHEAD-MCCLEANE COMPANY, Pittsburgh, have shut down their Plate mill for repairs. The demand for their Galvanized Iron is said to be greater than at any time in the firm's history. Any accumulation of stock is found to be impossible at present.

MATTHAI, INGRAM & Co., New York office 42 Cliff street, have about finished refitting and arranging their new quarters recently occupied. They now have a large and attractive display room, well lighted and ventilated, and sufficient space to properly sample their large line of plain and decorated, stamped and pieced Tin and Iron Ware, and kindred goods. The walls have been painted, ceiling tinted, and the entire floor laid with linoleum. In front a space has been railed off for desk, safe, and for office purposes. The two upper lofts allow of a sufficient quantity of stock being carried to meet any demands likely to be made on it, and the situation being right in the heart of business in their line, they are likely to be much benefited by the change. We

are informed the ravages made by the recent fire in Baltimore have about been made good, a prompt adjustment and settlement of insurance having greatly facilitated matters.

MERCHANT & Co., Philadelphia, Pa., make an interesting announcement this week respecting their Spanish Tile, the general appearance of which is shown in the illustrations and its merits referred to in the descriptive text that accompanies the cuts.

IN THE ADVERTISEMENT of the Knox & Stonier Architectural Sheet Metal Ornament Company, Toulon, Ill., attention is directed to Architectural Sheet Metal Ornaments and Statuary of their manufacture. They make a varied line of articles of this sort, and invite the trade to send for catalogue and prices.

N. A. HALDEMAN & Co. of Philadelphia have just issued a 40 page catalogue of their steel and iron roofing. In an address to patrons found on the third page it is remarked that the catalogue is the sixteenth of their annual issues. Attention is also directed to the fact that their removal to the large and commodious building on North Second street was necessitated by the requirements of their business. The contents of the other pages cover the Bessemer steel roofing (N. A. Haldeman's patent), iron roofing, metallic cement, V crimp roofing, corrugated sheets, corrugated elevator sheets, curved corrugated iron, corrugated siding, beaded siding and ceiling, sheet-metal weather board, ridge, corner and hip capping, metallic paints, tarred felts, sheathing papers and Bostwick fire-proof steel lath. There is a good deal of practical information concerning the application of roofing materials to be found in the catalogue, and it will doubtless prove very acceptable to the trade.

SEALED PROPOSALS will be received at the office of the Village Clerk, Gordon, Neb., until June 15, for Pumping Machinery, Boiler and connections; also for open or driven wells of 500,000 gallons capacity, together with Pipes, Hydrants, Valves, Valve Boxes, &c.

NIAGARA STAMPING & TOOL COMPANY, Buffalo, N. Y., are sending invitations to the trade inviting them to inspect their exhibit of Machines and Tools for sheet-metal workers at the World's Fair. The exhibit is located at Machinery Hall annex, Section 28. The company issue an 1893 edition of their Tinners' catalogue of 56 pages, containing illustrations, descriptions and prices of Tools and Machines for working sheet metal. In compiling this catalogue it has been the aim to present the line of Machinery in a compact form, the various machines having been associated so as to facilitate the comparison one with another of Tools of similar nature.

AMONG newly authorized corporations in Illinois are the following: Quincy Steel Range Company, at Quincy; capital stock, $10,000; for manufacturing; incorporators, Lemuel C. Ross, Edward J. Drake and Adam H. Govert. The Dearborn Refining Company, at Chicago; capital stock, $30,000; for a general metallurgical business; incorporators, J. R. Dickinson, W. D. Millard and H. P. Smith. Sloss-Stein Electric Company, at Chicago; capital stock, $50,000; for manufacturing; incorporators, Sydney Stein, Aaron M. Sloss and Louis Stein. The Edwin S. Jackman Company, at Chicago; capital stock, $50,000; for the manufacture of railroad supplies; incorporators, Edwin S. Jackman, Albert W. Barnum and Henry C. Latsh. The Noteman Gas Generator Company, Chicago; capital stock, $100,000; incorporators, A. Noteman, Will R. Burritt and Day O. Crane. Silberhorn Refrigerator Car Company, Chicago; capital stock, $100,000; incorporators, William H. Silberhorn, John J. Silberhorn and Frank O. Weeks. Polo Electric Light Union, Polo; capital stock, $12,000; incorporators, Morton D. Swift, Horatio Wales and Daniel W. Beard.

FROM SEYMOUR & WHITLOCK, 48 Lawrence street, Newark, N. J., is received a red-covered catalogue of 64 pages of Seymour's Patent Rotary Ventilating Fans and Appendages. First comes an enumeration of their many uses, then a list of their patents. There are over 60,000 of these devices now distributed over Canada, Mexico, Central and South America. Cuts follow, showing Columnar and Ceiling Fans, as used in stores, restaurants, hotels and residences, run by belts from a power shaft. A man-power attachment is shown, to run six or eight fans for use where power is not obtainable, and another hand power for running a fan in a chamber. Next are some of the parts—idlers, pulleys, hangers, &c., and the price-list, with some instructions, and a list of the necessary particulars that should be sent with an order. There is a cut of Seymour's Patent Exhaust Fan, with a request to send for special catalogue for full particulars. Among the motors shown are the Parabolic Water Motor, the Whitlock Independent Vertical Engine, the Automatic High Speed Safety Engine, the Independent Engine, using oil for fuel, and an Electric Motor, which is shown in different sizes, and a resistance box. The last pages show an Electric Ceiling Fan, with description pointing out its special advantages over past construction.

The following table, published by the *American Manufacturer*, shows the exports of British tin plate to the United States for each month in the past five years. The figures given represent tons of 2240 pounds:

	1893.	1892.	1891.	1890.	1889.
January..	23,498	17,554	32,018	23,633	28,471

Totals..		276.479	325,145	31-,106	336,052

The machinists and most of the other labor unions in Boston are endeavoring to introduce a nine hour day, June 5.

Canadian railway companies appear to be of the opinion that matrimony is a good thing. A Dominion journal states, as a fact not generally known, that when a settler in the northwest territories want to go back to Ontario to get married the Canadian Pacific Railway sells him a matrimonial ticket at the usual rate, and on presenting the return coupon and a marriage certificate he is entitled to free transportation for his bride.

Ventilation of Basements and Cellars.

In all our large cities many basements and cellars are occupied as shops and stores, or as saloons of some sort, and the ventilation in them is proverbially bad. When a basement is entirely above ground, and has an ample cellar below it, it presents no greater difficulty in the matter of ventilation than rooms situated higher up in the building; but when, as is very often the case it is about half way under ground, or is substantially or actually a cellar, perhaps extending out under the sidewalk from 14 to 16 feet, and has no means of admitting daylight except through thick glass set in iron frames in the sidewalk itself, ventilation becomes extremely difficult in many cases, especially if there be not an ample subcellar below. A plan by which a cellar may be thoroughly ventilated has recently been worked out by a heating engineer in a neighboring city. The design was made for a billiard saloon in a large cellar situated beneath a restaurant. In this scheme air is taken in through areas in the rear of the cellar, and is to be forced through galvanized iron ducts extending entirely around the bottom of the basement room under the row of chairs provided for spectators, which are ranged around the apartment. The lower part of this duct—that is to say, that part which lies on the floor of the basement—is provided with openings that deliver the air forced in through corresponding openings through the floor into the cellar below, where, in winter, it is moderately warmed by passing it through box coils, whence it passes through distributing ducts arranged under the floor to numerous registers, also arranged around the room, and opening just above the platform for chairs that entirely conceals the main duct. The plenum is obtained by the use of a blower driven by a gas engine placed in the cellar below: but this may possibly be supplanted by an electric engine, when the installment is erected.

A Dull Tin-Plate Market.

"Flat, stale and uprofitable," describes the existing condition of the tin-plate market. For weeks and months dealers have been hoping against hope for the advent of a change for the better, and earlier in the year it was expected that, with the advance of the season, which was an unusually backward one, trade would brighten up. The result has been entirely disappointing, and it is unfortunately the case that except for a limited demand for ternes—which the domestic output is amply sufficient to meet—the general market for tin plates is now about as dull as it can well be, although many good judges believe it will be still worse before it becomes better. The reason is not far to seek. It is the same cause which has produced the general depression in business—an unsettled financial condition, with uncertainty as to future currency and tariff legislation. Money is tight, and although there is no lack of it, or of inclination to do business, there is a hesitancy in investment until it is known what September will bring forth. Advices from the other side describe similar depression in the Welsh trade. Although the tin-plate works are fairly well employed, the demand for all kinds of tin and terne is reported to have fallen off, and prices are lower than ever. The only business being done is of a "hand-to-mouth" description. Orders from the United States, which constitute the large bulk of the trade, are light and seem likely to continue so for some time. It is, therefore, improbable that the shipments of the next four months will come up to the average of those in the first four months of the year. Stocks in the warehouses at shipping ports are nearly double the amounts carried at this season of last year; and although the outlook for Welsh material is said over there to be hopeful, that view is not shared by importers on this side, who are perhaps even better able to judge.

Situation of Domestic Plates.

Meanwhile, in the United States, although there is a moderate running demand for roofing ternes throughout the country, and particularly for those of domestic make, the sanguine expectations entertained earlier in the year have not been realized to any satisfactory extent, mainly owing to the abandonment or postponement of proposed building operations in various quarters, incidental to the present financial uncertainty. A good deal of business was done earlier in coke brights for canners' uses, but canners generally are now well supplied; and, having placed their orders some weeks ago for June, July and August deliveries, few requests for spot supplies come now from this class of consumers. Other users of bright plates are buying only in small quantities to supply current needs, and dealers are not anxious to make sales at the present low prices, except on cash orders. The prospect of a possibility of tariff changes in the fall disinclines buyers to carry any unnecessary stocks of plates. Stocks throughout the country are very light, and, for similar reasons to the above, importers are sending over very small orders for Welsh plates. On the other hand, nearly all of the domestic works are reported as quite busy and piling up little or no stock, so that there must be some demand for American plates, although they are probably being sold on a narrow margin of profit. Prices are low and inclined to weaken still further in both the domestic and foreign article.

Uneasiness Among Stove Molders.

The prospect of a stove molders' strike is now looming up as another disturbing element in industrial circles. Protracted conferences have been held between representatives of the manufacturers and the workmen, covering a period of several months. The gravity of the situation is shown by the consideration of this question at two general meetings of the stove manufacturers, both held in Chicago, one in March and the other last week. At both of these meetings the sentiment of manufacturers was practically unanimous against granting an advance. The recent meeting was marked by a very unusual occurrence, not only in the stove trade but in any branch of industry. The General Executive Committee of the Iron Molders' Union of North America had been invited to attend and to state their case to the assembled manufacturers. They did so in a series of speeches which won hearty tributes to their ability from the manufacturers, who were, however, not to be convinced by mere eloquence against the dictates of prudence and commercial sagacity. While the molders had originally made a demand for an advance of 15 per cent., it developed that they were not determined to adhere tenaciously to this rate, but would have been willing to accept 10 per cent. They argued that the past two or three years had been very good years for the stove trade: that business had been unsually active and presumably prosperous, but that the molders had received no share of the prosperity save regular employment, while, especially in the West, the cost of living had advanced, thus really reducing their net earnings.

The Manufacturers' Position.

The answer of the manufacturers to the plea of the workmen was precisely what might have been expected in the present condition of general business. With banks failing, money growing scarce, collections hard to make, and other indications of trouble in the business world, they could but reply that an advance in wages was out of the question. Molders' wages are not low, taking a general view of the labor field, and the men should be well satisfied that no attempt is being made to reduce them. It was conceded by the molders that an advance in wages could not be made without a corresponding advance in the selling price of stoves. Animated by the usual confidence of non-business men, they asserted very cheeringly that this was an easy matter to do if all the manufacturers stood together. They lost sight of the fact that an attempt to advance stove prices would be deeply resented by merchants and consumers at a time when all other goods are becoming cheaper. As wheat is now selling at a lower rate than for over 30 years, farmers could not be asked to pay more for stoves.

No Time to Increase Wages.

With the hopefulness abounding in the breasts of those who are always sure of their wages at the end of the week, the molders refuse to attach much importance to the unsettled financial conditions of the country. They have no notes falling due which must be paid or otherwise taken care of, they have no heavy bills for material and little cash in sight to meet them, they have no employees expecting their regular pay on Saturday night, and they spend no anxious moments waiting to hear from shaky customers who must be carried a little longer. And yet some of them are in a position to know how difficult it is to raise money for enterprises which in ordinary times readily command capital. A molder of great prominence and influence in the trade can be cited who has but recently had an experience of this kind. It is claimed, however, that the rank and file and not the leaders are clamorous for an advance in wages, and that they will not listen to further excuses, but will insist upon fighting out the issue according to the usages of organized labor if their wishes are wholly ignored. This may be strictly true, but on the other hand there is some ground for the belief that the persistent effort of the molders to secure an advance in wages, notwithstanding repeated refusals by the manufacturers, is to head off any movement in the direction of a reduction. If there ever was a juncture in business affairs when it seemed necessary to prune costs in every direction and prepare for hard times it is with us now, and the molders know it. The agitation for an advance was begun when times were good, and may now be continued for defense when times are bad.

Prospects of a Strike.

As the second great assemblage of the stove trade has again emphatically pronounced against an advance in molders' wages, the relations of the manufacturers and their employees are now strained. The representatives of the union may have a lingering hope of a concession to be obtained in some way which will appease their followers, but the outlook is now very much in favor of a strike in the union stove foundries. How far such a strike may affect mixed and non-union foundries it is, of course, difficult to tell. The probabilities are that in most of these there will also be a strike. It was the case with the machinery and jobbing foundries in Chicago this spring. Union and non-union molders then acted together, and they will probably do so in the stove foundries. The stove manufacturers appear to be quite unconcerned over the prospect of a strike. In fact, the opinion is freely expressed among them that the stove trade this year would be benefited and not injured if all the foundries were to be shut down for 60 days or more. Some of the manufacturers may not have as much stock made up as they would like to see in their warehouses at this time of the year, but arrangements could doubtless be made by which regular trade would be provided for. The molders are deplorably deceiving themselves if they think that the manufacturers will weaken merely because this is usually the time of the year when they push work in the stove foundries to their utmost capacity.

Ways and Means of the Fair.

An innocent in Chicago sends us this letter:

If never another stroke was done to complete the exhibits which have been delayed, a good pair of glasses could be worn out in looking at all there is to be seen. The Midway Plaisance is like the pie to a dinner, an indispensable treat, but unless treated with prudence is likely to prove costly. On this avenue are transplanted enough of the natives of different countries for them to live exactly as they do at home, enabling a visitor to see why they do not use tin roofs in China and enameled bathtubs in Turkey, or sad irons in Africa, or washing machines in Hungary. If your curiosity is not too deep your quarters and halves have no need to be spent to see the many little shows all along this place. A good idea of the location of the various buildings can be secured by getting a 10-cent Rand & McNally map of the city and grounds. A 10-cent ride on the "Intramural" (don't be alarmed, the name is rather "too too," but it simply means that an electric elevated railway runs around inside of the grounds) will enable you to locate everything as it is on the map and only takes a short time. Another way to get this same information, though not so completely, is to take a 25-cent trip on one of the electric launches on the lagoon, and skim around by the buildings, between the ducks, swans and geese, and past the more lazy and luxurious gondoliers, under the bridges and arches, making a pleasant as well as profitable trip. Everybody will visit their own State building, but do not put it off until Sunday, for Sunday is traveling slowly, having not yet quite reached here, consequently the 26 States east of Chicago close their houses, while the 18 States west of it show at least a Christian hospitality. Uncle Sam has his building closed, too, but the main show is open and the band plays, though some exhibits are covered. If you get tired a chap will roll you around in a wheel chair for 75 cents an hour, or a pair of swarthy Turks, wearing condemned army Zouave breeches, will carry you about in a sedan chair for the best bargain you can drive, or about the same as a wheel chair.

An official guide book, in a dark red cover, costs a quarter, and may be of use to find some special thing, but the guards are very civil and generous in giving information, even if they are required to wear a strap to their caps, which must torment them by tickling their chins needlessly. Now that you have got your bearings, you start out to what interests you most, but do not forget the art galleries, for the most of us study art in money-making only and a sprinkling of another sort will not be amiss. The Manufactures and Liberal Arts Building is the biggest, and between it and Agriculture, Mines, Machinery and Electricity you will discriminate to suit your taste, if you are not going to stay and do all of them.

When you get hungry the Catering Company will fix you up with roast beef for a half dollar, but if you want to buy a sample of their entire stock it will cost you—a trifle more. Good drinking water is found all around the grounds, with sometimes an American tin cup and sometimes with one of enameled ware fastened to a chain, as they are not souvenirs. This fixes you up to do the inside properly at a figure to suit yourself, but on the outside, if the man from the windy West can get away with the calculating "wall I want to know" man from the East, they will have to settle the difference. It is enough to say that if you are willing to put up with a Western lack of luxury that is not exactly agreeable to the fastidious East, you will not have to spend all you have saved up in a life time to pay your board and lodging. There are some hotels here which are doing business just the same as if Columbus had never been born; no, not just that, but surely the same as if he had not been rediscovered and set up in Lake Front Park.

Come out and see the fair, it is worth all it costs, but just recollect that they burn soft coal here and the air is full of soot, so that if you wear a shirt a week it will look as well as the fellow's who put his on in the morning. Do not forget that and dress accordingly, for if you get your wedding suit ruined by a coat of black soot you may have to stay at home for the want of something stylish when your wife goes to a church sociable.

The proposed East River bridge will probably cost between $25,000,000 and $30,000,000, according to the testimony given before the Commissioners by George B. Cornell, the engineer of the company.

A model workshop for the manual training school at Brookline, Mass., is about to be erected at a cost of $30,000. The building will be 150 x 170 feet in size, modeled after an old English schoolhouse and be equipped with a 15-horse motor, foundry, forge room, machine tool room and lathes.

THE LETTER BOX.

Warming a Church.

From C. F. S., *Louisville, Ky.*—In *The Metal Worker* of April 15, page 40, I notice a diagram showing the furnace and connecting pipes of a church job. It is a difficult matter to determine the trouble in such cases without a personal examination of the faulty jobs, as sometimes adjacent buildings or fences prevent a free flow of air into the cold-air opening. It is supposed the furnace is of sufficient capacity to heat the building under favorable circumstances, has a pit under the furnace of not less than 15 inches in depth, the hot-air pipes have an elevation of at least 1 foot in 10 and the opening of cold-air duct is either on north or west side of building. After a careful examination of the diagram and the remarks regarding it, the following is offered as a solution of the difficulty. It will be necessary to place the opening of the cold-air box forward until a proper exposure from the north or west is obtained. The conflicting of cold-air currents is avoided, the action from inside and outside being positive, as the currents are controlled by dampers placed at the month of the air-supply box and near the point where the exhaust boxes connect with it. The hot-air pipes leading from furnace to registers in the corners of the building should be covered with asbestos paper. The two 12-inch cold-air boxes from the front and rear of the church should enter the sides of the cold-air duct underground and connect with an elbow inside of the air-supply box, with the opening toward the furnace. A better way of heating the church would have been to use two 20-inch pipes and 20 x 20 register faces with borders, taking the cold air from the church from the side aisles.

Protecting Stove Pipes.

From E. F. B, *Greenville, Pa.*—If your correspondent "A. H.," Shelbyville, Ind., whose letter appears in *The Metal Worker* of April 1, and also your correspondent "C. H. H.," Valparaiso, Neb., whose communication was presented in the issue for April 22, will cover their smoke pipe and smoke stack with a good coat of asphaltum varnish, inside, before putting them up, they will find that they will last much longer.

Air Chamber on Force Pump.

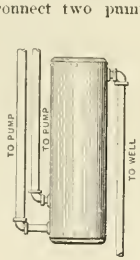
From I. R., *Norwich, N. Y.*—What is the advantage or object of using an air chamber in connection with a force pump?

Answer.—In a common force pump, or one that is not provided with an air chamber, the liquid is discharged at each stroke of the piston, the result being that at each stroke the pipes, valves and other parts are liable to receive a sudden shock. The air chamber, which usually consists of a dome-shaped vessel, is placed in the discharge pipe near the pump. In case the discharge pipe has a small opening, or there is some resistance to the flow of water, as in filling a steam boiler, the entrance of water into the chamber will cause the air to be compressed, which thus exerts a continuous pressure upon the surface of the water. Providing the supply of water is sufficient to maintain this pressure, the air by its alternate expansion and contraction secures a steady flow of liquid through the discharge pipe.

Charging Chamber for Pumps.

From S. G. E., *Fremont.*—Can you tell me if I can connect several pumps with the same supply pipe and have them all work properly, and, if it can be done, how to do it? I remember seeing a similar question and the answer in *The Metal Worker* some time in 1890, where by the use of a charging chamber a number of pumps could be used on one supply pipe. Who makes such a chamber, and where can I get one?

Answer.—In *The Metal Worker* of May 31, 1890, a correspondent asked how to connect two pumps on one



Charging Chamber for Pumps.

pipe, one pump being in the basement and the other on the floor above. The answer suggested that a Y-branch be made on the main pipe, to run off a short distance before connecting with the lower pump, letting the main pipe run to the other pump, and it was stated that if the valves were perfectly tight the pumps would work all right and independently. If, however, when pumping on the first floor an air leak existed in the basement pump the operation would fail, and as it is not probable that the valves would always continue tight, the use of a stop cock was advised in both the branch and main. A sketch, as shown, appeared June 21, 1890, from a correspondent, "S. R.," Philadelphia, who stated that two or a dozen pumps could be attached to one supply pipe by the use of such a charging chamber. The successful operation of the pumps connected with it, however, would depend entirely on the absolute and continued tightness of their valves. Opinions vary as to the advisability of its use and the saving effected. The chamber could be easily made by a tinner of galvanized iron sufficiently thick to prevent collapse under the action of the pump. A depth of two to four times its diameter is desirable. The supply pipe should be provided with a check valve at the bottom, and connect with the chamber at the highest point on the side. The pipes to supply the pump should connect with the chamber on the side at the bottom and be located an equal distance apart. As a precaution against the charging chamber making trouble by becoming empty from any cause, an opening in the top should be made and provided with a screw cap that would enable it to be filled with water, should necessity occur.

Warping of Sheet-Iron Pans.

From W. B., *Boston.*—In answer to "F. J. H.," Rochester, N. Y., who has had difficulty with the warping of sheet-iron pans for a bakery, it may be possible to take out the "twist" by placing the pans on a level surface, with the wire down, and tapping the corners with a mallet. When making pans of this description, the edges can be turned up and over in a brake, then the corners turned over on a stake. The wire or rod should be formed to the required size, and welded at the corner, care being taken that the rod is level and free from twist. After the rod has been placed in position and the edges turned over, the pan should not warp when in or out of the oven. If the rods are not level before being placed in the pans it will be difficult to take out the twist or warp.

White Lead Paint for Tin.

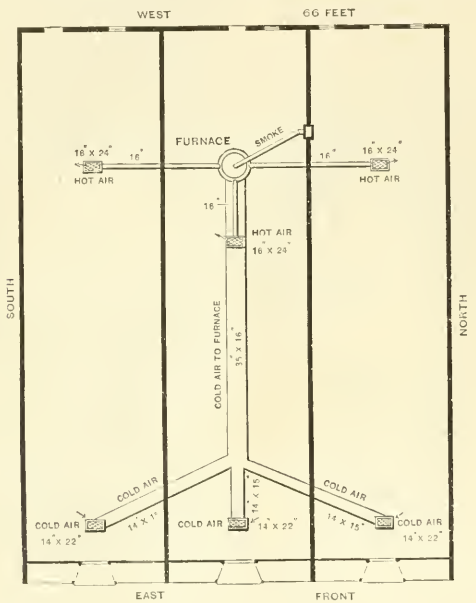
From J. C. R., *Charlottesville, Va.*—I would like to hear from my brother tinners regarding the painting of tin spouting and gutters with white lead paint, and if it is considered injurious to tin work that is exposed to the weather. I have repaired tin work that was put up years ago, on which white lead paint was used, and found the work well protected, but have thought that, perhaps, it was owing to the good quality of tin used in those days. I have heard experienced painters discuss the question. Some would contend that white lead paint was injurious to tin, while others would maintain the opposite to be the case.

Note.—It is supposed our correspondent refers to white lead combined with linseed oil, and not to any mixture in which linseed oil is not used. It is generally considered that the efficiency of a paint for coating metals depends upon the oil which, when drying, leaves a hard skin or surface. It would appear that a proper pigment to use would be one that contains nothing that would injure the surface upon which it was placed, and would carry the most oil. In this respect white lead is well adapted to the purpose, providing the exposed surface is

kept covered with the paint. A correspondent writes regarding this subject: "I doubt if anything will beat a good coat or two of white lead and linseed oil, which you can color to suit yourself." So much said, we should be pleased to have our readers express their opinions on the subject.

Furnace to Heat Three Stores.

From E. E. W., *Veedersburg, Ind.*—Will you kindly examine the sketch shown and give me an opinion as to whether my plan is likely to heat the building satisfactorily. I also submit it for comments of other readers. The building is brick, fronting east, two stories high, but only the first story is to be heated. It is 66 x 80 feet and divided into three stores, each about 22 x 80 feet. The cellar is 7 feet in the clear, and an extra large portable furnace will set over an air pit. Air is to be taken from each room through 14 x 22 exhaust registers, located at the front and connecting by air ducts, as shown in the sketch, with the air pit under the furnace. A 16-inch hot-air pipe runs from the furnace to a 16 x 24 floor register in each of the stores.



Furnace to Heat Three Stores

Note.—The proposed plan seems to need only care in arranging the details to prove satisfactory. If the building is exposed on all sides, the north store will be the most difficult to heat, and to insure its getting a full supply of hot air it would be well to divide the space in the furnace top above the heating surface by sheet-iron partitions, giving the north store the greater space. A similar arrangement at the juncture of the air ducts will tend to make the exhaust from each store more nearly equal. The length of the pipe to the south store in ordinary weather will not be a disadvantage, but as it will be about 20 feet to both of the outside stores particular care and extra work if necessary should be given to providing a sharp rise of the pipes from the furnace to the registers, particularly favoring the north store, which requires the most heat. This caution will be specially applicable, as the cellar is only 7 feet deep, and an extra large portable furnace is likely to stand 6 feet high or over, which only leaves 12 inches of rise for the hot-air pipe in a run of 20 feet, which is not enough for the best results, and more should be secured even at some expense. The air ducts will aid the general efficiency if they are air tight, and nothing surpasses galvanized iron in attaining this end.

Galvanizing Corrugated Iron.

From C. M. T., *Illinois.*—In *The Metal Worker* of May 13 is a letter from "W. J.," Bay City, Mich., who wishes to be informed how to galvanize pieces of common black iron, corrugated, about 15 x 30 inches in size and of about No. 26 gauge, which are made up in the shape of shelves, &c. In answer to his inquiry allow me to suggest that he use commercial galvanized iron for the shelves, as it will be much cheaper for him than to attempt to do his own galvanizing. Or, if it is necessary that the work should be galvanized after it is formed, have the operation performed by those in the business. A galvanizing plant is somewhat expensive to create and maintain, besides, considerable experience is required in order to produce satisfactory results. The zinc or "spelter" should be kept at a certain temperature when in use, and to do this requires a "knack" that is only acquired by practice.

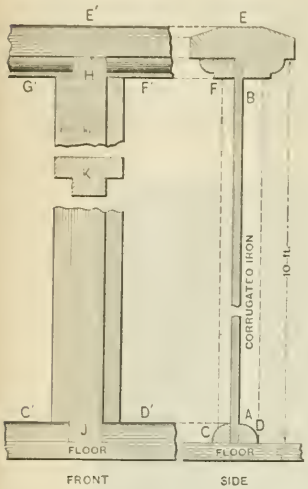
To galvanize iron the first step is to clean the sheets of all oxide, which is done by standing them on edge for six or eight hours in water containing 1 per cent. or over of sulphuric acid. While in this pickle, which should be kept hot by means of steam pipes, the sheets should be agitated so that the acid can reach the entire surface. The acid should be renewed occasionally, according to the quantity of iron pickled. After pickling the sheets are rinsed in water and scoured with sand and water, and a piece of cork or piece of the husk of the cocoanut, the ends of the fibers serving as a brush. Or, slight spots of oxide can be removed by means of a sharp scraper. It must be understood that any particles of oxide on the iron will prevent the zinc from adhering. This part of the operation is regarded by galvanizers as one of the most important in the whole process. The sheets are then rinsed again and dipped for a short time into commercial hydro-chloric acid, and finally placed on an iron car and shoved into an oven to dry. When the sheets are taken from the oven they are ready for the zinc bath.

The wrought iron pans containing the zinc bath are from ½ to 1 inch in thickness, depending on the size, which would depend upon the kind of work done. The pans, on account of their great weight, usually rest on a solid brick foundation and are surrounded at a distance of 6 or 8 inches by walls of fire brick. A coke fire is maintained in the intervening space, the necessary openings being provided for the admission of air, and a smoke stack provided to remove the products of combustion. The openings between brick walls and pan can be covered with iron plates. A wide flat-iron bar runs lengthwise through the middle of the bath so as to extend about 3 inches into the zinc. On one side of the bar the metal is covered with sal-ammoniac and on the other with coke breeze so as to cool off and clean the sheets as they are drawn from the melted zinc. A clean sheet is passed into the bath on the side covered by sal-ammoniac and allowed to rest for a short time on the bottom, then tilted so as to be taken out on the other side through the coke breeze, a pair of tongs being used for the purpose. When the sheet is removed from the bath, care is taken that the surface of the metal is kept covered with the coke to prevent oxide from forming. The sheet is then laid on a table and wiped or whipped with a piece of canvas to remove any surplus metal. While one sheet is being finished another is put in the bath, and thus the operation is continued. For galvanizing commercial sheet iron the wrought-iron pans are made from 1 inch iron, from 8 feet to 11 feet long, about 2 feet wide, and from 42 to 50 inches deep, and hold from 18 to 25 tons of zinc. On account of this great weight it will be seen that a strong foundation is required. The crystalline appearance of the finished plates is produced by adding a small quantity of tin to the melted zinc. In case it is not convenient to finish the black sheets when taken from the pickle, storage tanks are used in galvanizing works for holding the cleaned sheets until they are to be galvanized. These storage tanks are made of 2-inch pine plank (as are the pickling tanks), and simply filled with clean water into which the sheets are placed, which prevents the formation of oxide on the surface of the iron.

Philadelphia's output of gas for the year 1892 amounted to 3,585,158,000 cubic feet, the greatest consumption in one day being 16,328,000 feet. The receipts of gas companies reached the sum of $3,845,835, being an increase of $71,753 over those of 1891. The city has over 1,100 miles of gas mains and 20,000 street lamps, which consumed last year 501,160,281 cubic feet of gas.

A Corrugated Iron Partition.

A number of store buildings in Chicago are being changed into hotels for use during the World's Fair, after which they will be again used for commercial purposes. Among the problems presented in thus changing the interiors is how to construct the numerous partitions in such a manner



A Corrugated Iron Partition.—Fig. 1.—Front and Side View.

that they can be taken down without injury to the building and at the same time be cheap and to a certain extent fire proof. In over ten of these buildings corrugated iron is used for the partitions. Light studding is placed in the usual manner, or if it is desired to have a circulation of air through the building, the studding does not reach the ceiling—a top plate being used to hold the parts in position. Corrugated iron is then nailed on the studding, the sheets being placed perpendicular or horizontal to their length, as is most convenient. In either case it has been necessary to drive nails through the iron in order to fasten it securely to the studding, thus injuring the iron in case it should be desirable to sell it after the partitions are taken down.

Boddie Bros. own a six-story building that extends 146 feet on Jackson street and 100 on Franklin. This building has been occupied as a wholesale house, and was unobstructed with partitions. As the building was to be unoccupied until December, it was resolved to convert it into a hotel for the accommodation of World's Fair visitors. For this purpose five of the upper stories were to be divided into rooms, the first being retained for restaurant, barber shop, office, &c. Lath and plaster partitions would be too expensive, besides there was not sufficient time for their erection. Board partitions were out of the question, not being sufficiently fire proof. It was decided to use corrugated iron in the construction of the partitions, providing they could be made in such a manner as to use commercial iron and not injure it in any way, so that when the partitions were taken down the iron would be in a condition to be sold at a slight discount on the original cost.

The matter was placed in the hands of Architect Chas. C. Scott, who devised a method for constructing the partitions without injury to the iron, as shown in the following illustrations. In Fig. 1, side view, A B represents a sheet of corrugated iron 10 feet in length. The iron is secured at the floor by quarter round pieces, C and D, which are nailed to the floor. The dotted lines indicate the studding which supports the cap mold E. The iron is held in position at the top by means of the molding F, which is nailed to the cap mold E. In the front view J' H' represents a stud, the profile of which is indicated by K'. The cap mold is indicated by E', the top mold by F' G' and the quarter round by C' D'. In the plan, Fig. 2, two of the studs are shown at M and N. The quarter round molds are placed inside the partition, as indicated by O P. The studs are notched to receive the chair rail S T, and the molds C and F of Fig. 1 can be placed in the same manner. As will be seen in Fig. 1, the iron is secured at the floor by the molds C D, and at the top by the mold F, without driving nails through the iron.

Fig. 2.—Plan of Partition.

In Fig. 2 the method of securing the iron is shown at Q and R. Brads are driven over the edges of iron and into the studs, thus holding the iron in position. The method used in hanging door to stud is shown in Fig. 3. For the construction of the partitions in this hotel, which is to be named the Great Western, 1400 squares of corrugated iron and 85,000 feet of molding will be required.

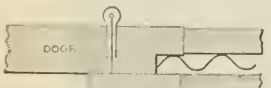


Fig. 3.—Method of Hanging Door.

Owing to increasing trade between Canada and China and Japan, via the Canadian Pacific route, Canada is about to appoint resident corresponding agents at Yokohama, Hong Kong and Shanghai.

The production of gold in British Guiana during the first quarter of the present year amounted to 24,470 ounces, as compared with 21,770 ounces in the corresponding period of 1892.

Glimpses of the Fair.

S. J. Meeker, Newark, N. J., Malleable and Gray Iron and Brass Foundries, Newark, N. J., U. S. A., has an exhibit that tells its own story, the letters being placed on a white wood background and formed of castings of the different materials and various articles made by him.

Alan Wood Company, Philadelphia, have a house made of their sheet iron, roof, cornice, walls and ceiling displaying some fine designs and workmanship, as well as the uses to which their goods may be put. Samples of many of their galvanized and black iron and steel plain and corrugated goods are used to wainscot the lower and upper parts of the side walls, enabling the sightseer to get a good idea of their lighter goods.

Randolph & Clowes, Waterbury, Conn., show an enterprise that is reflected in their exhibits, as they have two. That in the Liberal Arts Building is made up of copper circulating boilers of different sizes and beautiful finish. One boiler is cut in half, vertically, showing their spiral reinforcement to prevent collapsing and the way all seams and joints are made to insure strength. The exhibit in the Mines Building is the more extensive and handsome. The space is inclosed with alternate brass and copper tubes and roofed with a similar effect. At each side of the door at the front and at each corner is a copper torpedo shell. Inside a display is made of ingots, kettles, coils, boilers and many articles, showing the manner in which brass and copper can be worked and used.

The American Tripoli Company, Carthage, Mo., make a fine display of tripoli in all of its various forms, with samples of the raw material; also an elaborate showing of its uses for filtering purposes.

The Carborundum Company of Monongahela, Pa., show their product, which, it is claimed, has all of the properties of emery, is harder, cuts more rapidly, does not draw the temper and can be used wet or dry.

Phœnix Crucible Company, Taunton, Mass., have arranged an attractive display of their crucibles varying in size from a miniature to the extra large.

The Tanite Company, Stroudsburg, Pa., make an interesting exhibit of emery goods, showing in glass jars and cases the different grades of the raw material and the various ways it is manufactured for use, from the fine powder to the large wheel. An interesting comparison between the cutting of the best file and an old emery wheel is made in both steel and cast iron.

Jos. Dixon Crucible Company make a fine display of their goods. A hardwood finish incloses their space, which has an elegant carpet on the floor. Glass cases on one side make a complete display of kilns and crucibles. Another case contains jars with samples of plumbago from Ceylon, Bavaria, Mexico and Ticonderoga, N. Y., as well as pulverized plumbago for a great variety of uses. In another case is a display of pencil leads and crayons and many articles used for electrical resistance. The use of lead in electrotyping is shown, from the wax sheet to the finished electrotype. On a pedestal is a fine lump of Ceylon lead weighing 269 pounds, and on another is a monster retort for refining silver.

ROOFING AND CORNICE.

The Skylight Competition.

We take much pleasure in publishing this week the result of the Skylight Competition that was announced last January in *The Metal Worker*, and which closed the first of April. As we stated at the time, the responses were numerous and the general character of the work displayed in the essays was of a high order. The number of the contributions made it necessary to spend not a little time in reviewing them that the decision should be perfectly just. Several experts were consulted in the task of rendering judgment and the decisions given independently by them coincided in a remarkable degree.

The first prize of $75 is awarded to Henry M. Sanders, 1016 Tenth street, N.W., Washington, D. C., whose essay was submitted under the *nom de plume* "Kappa."

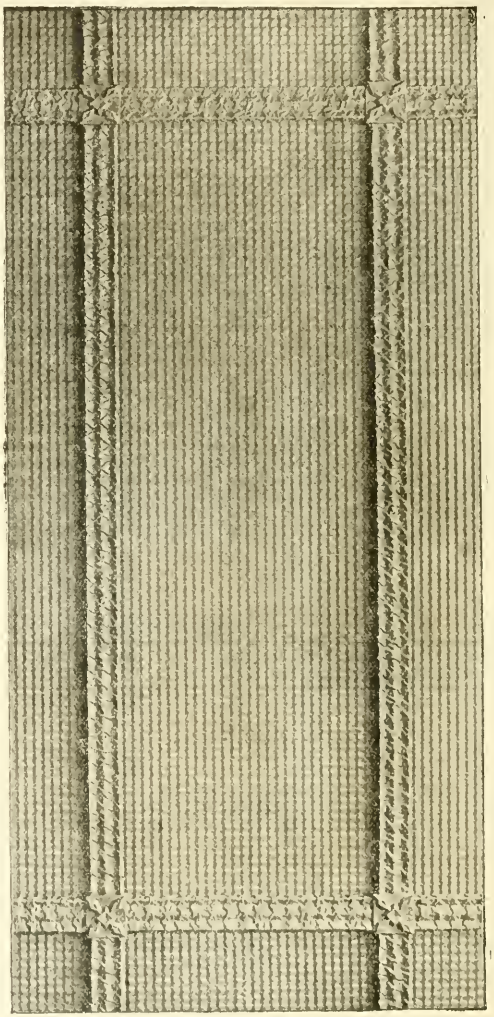
The second prize of $50 is awarded to John C. Dressel, 1645 Inyo street, Fresno, Cal., whose essay was submitted under the *nom de plume* "By one of the craft."

In addition to the prize winners, there were also several essays which on study proved to have many excellent points. The three which it was decided particularly deserve mention are the essay submitted by "Nemo;" the essay submitted by "T. H. V.," and the essay submitted by "Argus."

We take this occasion to congratulate those who are prize winners in the competition, and at the same time express our thanks to the many other contestants who took part. It is our purpose to publish some of the essays in the columns of *The Metal Worker*, and we believe that they will be read and studied with much interest.

Tufted Metal Ceiling.

The accompanying illustration shows a design of a metal ceiling brought out by the Garry Iron & Steel Roofing Company of Cleveland, Ohio. It is a curious style and one that will attract attention, as it has the very desirable feature of being a new ceiling, has a substantial appearance and at the same time a pleasing effect. A special application to which metal ceilings are put is in large public buildings, banks, hotels, business offices and such structures where durability is the main object and where there will be no danger from falling plaster.



Tufted Metal Ceiling.

Paint for Exposed Iron Surfaces.

The question of the best paint for use on iron surfaces exposed to extreme atmospheric influences is one of great interest, especially to roofers. The following extract from the letter of a correspondent in *Painting and Decorating* gives some hints on the subject which may be worth attention: "Seeing nearly every month that some attention is being given to the painting of iron work exposed to severe atmospheric influence, I would also give my experience of 40 years. It was about 30 years ago that I first began to take any interest in the causes of decay in paint on iron surfaces, and then I began to think and inspect work I had done ten years previously. About 35 years ago I had to do some iron rods, which were string bolts for holding a large roof together in a flax-spinning factory. These rods

had been psinted with oxide of iron and had rusted. They were cleaned to the iron, and so thoroughly that the iron was made bright with rubbing. I had to paint them with red lead mixed with half oil snd half turps and some liquid dryer of my own make. This dryer was composed of black wad, red lead and oil boiled to a pulp and then thinned with turps. The second coat was about the same as the first. The third contained less turps, and the fourth and last hardly any turps. This work has not been done since, and is to-day as perfect a protection to the iron as then. Four years ago I visited the place and was allowed to examine these bolts, and when I scraped off the paint the iron was as bright as when I painted them. Another case is a water wheel which has been built 75 years. Twenty-five years ago I had a contract to paint this wheel. The owner thought that he would have it cleaned and painted. I employed men to clean it thoroughly, and to my surprise I found no rust. When I called the attention of the owner to the fact he informed me that his father had had it painted 50 years before, when it was built, and the red lead was made from ore got in a bill just by and smelted in the village. However, I gave it two coats of red lead, mixed as I have stated. This wheel is still running, has not been painted since and is in good condition. Now, in regard to work rusted on a smooth surface, I have done work of this kind also which has been exposed to the sea air. My first step is to clean thoroughly, and then, if badly rusted, to mix a thin mixture of lampblack with plenty of turps and dryers and little oil, and when dry apply the red lead as above. This will give a lasting job, as the lampblack arrests and prevents the rusting. In conclusion, I would say that if any of your readers want a good, permanent job of iron painting let them try the above plan, and I am sure that they will be repaid for the trouble and extra cost as compared with the customary wash of metallic paint and oil."

A Trade-Mark in Sheet Metal.

A Trade-Mark in Sheet Metal.

We lay before our readers this week a half-tone engraving of a sheet-metal statute recently completed by W. H. Mullins of Salem, Ohio, for the Moline Plow Company, as a part of their exhibit at the World's Columbian Exposition. The statute, which represents the Flying Dutchman, the copyrighted trade-mark of the company named, is of heavy copper, mounted on a copper pedestal 6 feet in hight. The whole figure, including the pedestal upon which it rests, is 18 feet in hight. The ear of corn shown is perforated and so arranged that an electric light inclosed within it will shed its rays through the openings. The engraving which we present herewith is an exact representation of the statute and shows it in every detail. Some may, perhaps, be inclined to criticise the proportions of the figure, but we would state in this connection that the idea is to represent a burlesque rather than a figure of strictly accurate outline. How successful Mr. Mullins has been in carrying out this idea may be inferred from an examination of the picture.

FLASHINGS.

John Galt & Son, 52 John street, dealers in roofing slate, confess to a good volume of business, which is quite in contrast with many New York interests. It should be remembered, however, that little or no stock was manufactured during the winter, and the present demand keeps them actively employed.

A large and growing market for galvanized sheets, both plain and corrugated, for roofing purposes, is reported from Cuba. This material is said to be coming into extensive use in the island. Sheets of a smaller size than those generally used in this country are chiefly in request. A well-known New York export firm have lately shipped some large orders in that direction.

Last week a seizure of smuggled tin plates was made by the customs officials at Eastport, Maine. The material had been brought over in a schooner from New Brunswick, across the St. Croix River, and was intended for the use of some manufacturers of sardine boxes in Eastport. Two hundred boxes of tin plates, on which no revenue had been paid, were confiscated. It is believed that a scheme for defrauding the Government of revenue in this manner has long been in operation in those parts.

STEAM AND HOT WATER.

Fifth Annual Convention of the Master Steam and Hot Water Fitters' Association.

The fifth annual convention of the Master Steam and Hot Water Fitters' Association of the United States held their first session at the Revere House, Chicago, on the 6th inst. President P. S. Hudson called the convention to order at 10.45 a.m., and proceeded to business by appointing John B. Hughes of St. Louis sergeant-at-arms in the absence of D. F. Morgan. Next followed the designation of a Committe on Credentials, consisting of Messrs Kenrick of Boston, Barron of New York, Simmons and Lamb of Chicago and W. B. Thompson of Philadelphia. The reading of the minutes having been dispensed with, President Hudson proceeded to read his message, as follows:

Address of President P. S. Hudson.

Friends and Fellow Members.—I am pleased to congratulate you upon the favorable promises of this, our fifth annual meeting. The gates of our city are open to-day to the inhabitants of the world. This certainly includes all of you. It is an incident that cannot in a like manner occur again in the lifetime of any of us. At this moment you are adjacent to, or, from your seats, within 30 minutes of the greatest preparation for and the grandest display that ever graced the face of the earth.

Then why should I not congratulate you, when we are privileged in this, the most important event of our business year, to lay our plans in the shadow of the first stupendous celebration of the most astounding, the boldest as well as the most gloriously beneficial event that ever befell mankind. Would that some intrepid, firm and sagacious commercial mariner, like Columbus, could sail into the business world in these our fiercest days of competition and classify and regulate trade as it should be done.

In behalf of the members of the Chicago Local I extend you a most hearty welcome, and hope that your visit to us on this occasion will be of so pleasant and useful a nature that it will prove one of the eventful milestones in your lives.

The Executive Committee have covered the special business features in their report, which has my approval, leaving it unnecessary for me to refer to them. There are a few matters, however, which I consider it important to touch upon, and I beg your patience while I do so.

PLUMBERS AND STEAM FITTERS.

A sentiment seems to prevail with some firms, both in the heating and plumbing business, that there should be an amalgamation of the National Associations of Master Fitters and Master Plumbers. I see how readily this view can be taken in cities where the plumbing firms all do steam and water heating, but how would such an arrangement work here in Chicago, which is fairly illustrative of all the large cities?

We have some 38 members in our local, which includes nearly all firms that can be classed as steam and water fitters in the city. You can allow for ten more, which would certainly cover the field. In this I do not include those who have signs up but have practically never done any work.

I am not posted as to how many plumbing firms there are in Chicago, but there must be over 500, and possibly 1000. I cannot conceive of such a thing as 500 plumbers considering and acting upon a business that not more than ten of them are engaged in, either locally or nationally, in the same ratio.

Several stove firms are doing water heating at the present time. Certainly we could not entertain a thought of our order amalgamating with the Stove Association, and there can be but little difference in the two propositions.

I should look upon such an arrangement with the latter as taking steps to invite more stove men into steam and water heating, which I would certainly hesitate to do, and they could thank me for impressing upon them this view, for there are more in the business now than is any way beneficial to their financial health.

I can truly say that if I were to add a plumbing department to my business today, I should be just as unalterably opposed to the amalgamation of the two associations as I am now, for surely when I discuss the commercial features of our line (which associations are formed for), I want my conferences to be with those regularly in the heating business, always recognizing a plumbing firm who has a steam or water heating department as one of us. There has been so much discussion upon this subject outside the association that I fear many plumbing houses having a heating business as well have withheld their memberships from our organization believing that ultimately such a union would be effected. At all events, I can see no other good reason why more of them have not joined with us, for in many localities they have been suffering from abuses of every description. In the State of Nebraska, for instance, where, at this writing, we have not a single member, I do not believe any great amount of money has been made within the last three years on the total heating, and until such a time as they take steps to act more in harmony and look after daily transactions with greater care, I do not think very much success will be met with.

I do believe, however, that the Executive Committees of the two organizations should work together for mutual advantage. Frequently both are badly treated by firms who sell steam heating and plumbing supplies combined, and undoubtedly by a united and fraternal action of the two committees much good could many times be accomplished. I feel that the question of amalgamation is one which should be settled at this convention, and while I do not recommend it, I would suggest that a committee might be appointed to consider this matter.

THE HOT WATER TRADE.

On account of some recent business changes, I believe our interests have some assurance of more rational treatment in the future from hot-water boilermen. However, we can never tell when fresh capital will be found to support some enthusiast over a new discovery in the way of a boiler for heating. Such parties could be of great benefit to our commercial interests, to the public and to themselves if they would refrain from inducing tinsmiths, hardwaremen and others who have had no experience in the fitting business attempting to install plants that not one of you or I would undertake at the prices they make.

I would only be too willing for a boilerman in whose goods I had confidence to bring me work where the soliciting and preliminary labor had been performed, provided they could show a safe and reasonable profit in it, but because they cannot do this they do not come to you nor to me. They seek some one without experience, whom with paper and pencil they convince that there is open to him through their instrumentality a new and wonderfully lucrative field.

It is not necessary to comment. You men cannot have forgotten your early experiences. You know what the awkwardness and result must of necessity be with those who have it all to learn.

Many business men have been materially injured by this method in the past three years, and the miserable success that has been met with on account of it has offered an almost unanswerable argument for furnace heating, and has caused much of the latter where hot water or steam would have been used if the faith of owners had not been entirely shattered by the miserable success their friends and neighbors had met with, which is chargeable wholly to the want of experience on the part of the man who lost money doing a wretchedly poor job.

The sum of it all is, capital has been wasted in large quantities, contractors have been crippled; the public has been injured and imposed upon, and our line of business has received a set back that it will take a long time to recover from.

As said before, I believe we have seen and felt the worst of this condition and am looking forward with the hope of a marked improvement.

CHARGES AGAINST THE ASSOCIATION.

No doubt all of you are familiar with the recent attack made upon our association by the St. Louis *Republic*. The issuing of our inquiry to sellers of steam and water fitting supplies, and its publication, together with the replies received, called forth the fiery criticisms.

We are charged by the *Republic* with being a trust, that and other papers calling us blackmailers, &c., adding the claim that we are trying to prevent open competition to the consumer.

While it is not necessary for me to say to you, gentlemen, that not one of these accusations is true, it may be my duty to make a statement that the public may not be misled by any such sensational articles.

Has the retailing business any fixed rights? If so, has one firm a right to confer with his neighbor as to what such rights are? Custom makes law. In the memory of all of us there have been three fixed classifications of trade: 1, the manufacturer; 2, the jobber, and 3, the retailer. If custom has made and can make law, then the principles of this one in the classification of trade are as firmly fixed and accepted as those that appear on any statute.

Are statutory laws ever broken? Are laws of custom ever broken? To both questions we must answer yes. Can we as master fitters show that we have been damaged because of the want of proper respect for the latter law? With much feeling we can claim that we have been materially handicapped in our business by the disregard of it. For the past ten years, chiefly on account of the bitter competition in the supply trade, our people, who are the retailers, have not received full justice at their hands.

Unlike other laws, those of custom are left to take care of themselves.

Under such circumstances have retailers in any line a right to ask jointly that the latter laws be lived up to? This is all our association has done and all it is formed to do. In fact, we have never asked nationally that the wholesalers live to the letter of the law. To do that we would have to request them not to sell to the consumer at all, which if we had done long ago I think would have caused less friction than the course that has been followed, for it does appear that the moment a consumer has the privilege to purchase of the jobber he expects all the discounts that are given to the trade, and if he fails to get them he is a sorely injured individual, although he may be a retailer in some other class of goods that pays four times the margin that what we sell to him would. And I presume if this same party should learn of a manufacturer in his own line retailing his goods he would not only refuse to buy of him, but would request that in the future he stay out of his place of business.

It does seem that a few, in the face of all this, would stop and consider that they are only a part of mankind, filling one department in life that goes to make up the masses, and that what deference they would like to have shown the trade they are engaged in, they ought to be willing to grant to those in other lines. Self interest should suggest this to them, for when men all around them in other departments fail

to succeed, where is support for their own business coming from? I would ask, too, if any class is more sensitively affected by the success or non-success of the masses than the newspapers themselves?

When the charge is made that the consumer is robbed of the benefits of competition in our line by means of our association, it must cause a smile to pass over the countenances of all of you. I advise the reporters to interview a few men on that subject who have gone out of the business.

The legitimate place for the consumer to look for competition is with us, and in many instances I am sure they have in the past found it so severe that it has proved anything but beneficial to them.

You all know that we are invariably straining to get below our competitors' figures. This has been, and is being, carried to such an extent that the situation is truly an alarming one. The country today stands more in need of laws to modify competition in all classes of trade than it does for any that will invite it.

It could be said, and was years ago, that competition was the life of trade. It can truthfully be said to day that competition, as indulged in, practically forbids success and de-troys thousands whose prosperity the masses must be dependent upon.

There is a great and useful field here for honest newspaper work, but it cannot be done by young men who are without experience, no matter how bright they may be; neither can it be done by an older man who has devoted his life to the literary and publishing line. He has not come in touch with the special bitter of this sweet, except in his own department, which is so emphatically separated from other affairs that he has not the slightest conception of the struggle that the business masses, from the least to the greatest, are at this moment overwhelmed with.

From the standpoint of most newspaper articles, as they are written to day, with a view of influencing commercial legislation, they are doing untold mischief to business. An editor who is conscientious, just reasonably conscientious, will be very careful what principles he undertakes to have woven into legislation by professional politicians, whose only experience is how to secure votes. Surely he ought not to forget his own interest in the morrow.

I will close this subject by making the claim that while our association has been thus far a great benefit to ourselves, it has been a still greater benefit to our patrons, for in proportion as the art advances they are profited.

In the office of prosideut of this association, which honor you conferred upon me at the last convention, I am moved to thank you deeply. I desire to thank each member individually for the support he has rendered during the year. Our growth has been such as to be quite encouraging, and I hope that the labor performed at tuis meeting will be of so judicious and wise a character that all who should be enrolled with us will deem it to their benefit to become members, and that they will take steps to do so.

The Executive Committee, and others concerned, have rendered me all the aid I could possibly have desired. They have responded cheerfully to many calls for meetings, as the miuutes kept will show, and I desire to heartily thank them for the support they have contributed.

In passing this office to the hands of my successor, I can truly say that I do so with the conviction that having been brought into closer contact with the association's affairs has made me a much better member than I ever was before. And I can assure the member who takes upon himself the duties that I lay down that he will receive my hearty support, and I bespeak for him the same courtesies that have been extended to me.

Let us all adopt the motto that we will not criticise until we have thoroughly investigated, remembering that fore knowledge frequently saves us the embarrassment of changing our minds.

I will again affirm that our association is formed that the greatest justice may accrue to the greatest number.

Applause greeted the conclusion of the reading of the president's message, which had been very closely followed by the members of the convention. They were in hearty accord with the sentiments expressed. Secretary Geo. H. Reynolds next read his report, which is in part as follows:

Report of National Secretary George H. Reynolds.

After the Boston convention adjourned our attention was first directed to preparing association effects for removal to Chicago. Upon arrival here headquarters were secured at 628 Rialto Building. By June 9 we were regularly installed in our new offices, and had begun our labors for the year, our immediate efforts being turned toward disposing of work mapped out by the convention, such as issuing the usual amount of printed matter, &c.

The resolution regarding the purchase of radiators, as per the instructions of the Boston meeting, was circulated among the different locals for signatures. Having but one copy to work with, we adopted the plan of making two duplicates, with sheets so arranged that they could be detached and affixed to the original, thus hastening the results.

We have the three articles as they were returned, so far as this matter was proceeded with, and they are on the file for examination if any choose to look them over.

Prior to the return of the papers, a representative of one of the largest houses in the United States in the fitting supply line called at the national headquarters with reference to the radiator resolution. He said he thought it was bad policy; that it was in every sense objectionable to a seller of goods to make different rates between two buyers regularly in the contracting business whose trade was equally as desirable. After an extended discussion of the matter the party stated that neither he nor his house were going to antagonize our association, or its members, but sooner than make such a discrimination as asked for, the firm he represented would cease to handle radiators at all.

I will add that this came from one of the strongest houses in the United States, and from a firm which is considered very friendly toward our association.

The substance of the conversation was reported to the Executive Committee, and it caused them to give the situation very thorough consideration, and led to their inviting before them the principal man of one of the largest radiator manufacturing firms in the United States, to whom prior to this a form of contract had been presented for his opinion.

While he did not seem disposed to say much against the proposition, he requested permission to lav the paper before his attorney, the question arising with him as to the legality of such methods. His request was granted, he promising that as soon as he could procure the information he would report same to the committee.

A few days later he submitted the opinion of his attorney, copies of which were forwarded to all our members, thereby making it unnecessary to reproduce it here. We have duplicates, however, if any desire to examine them.

It is hardly necessary for me to state that the legal opinion was of such a nature as to cause the Executive Committee to drop this matter entirely.

During the time the radiator question was under consideration the Osborne matter was taken up, as per the direction of the Boston convention, pamphlets containing a copy of the discussion upon this subject being printed and placed in the hands of each of our members. The bills for the first assessment were sent out on July 15. No more money was called for as none appeared to be required, until in April our treasurer received a letter from E. P. Bates indicating that a suit would be brought to trial. In such an event manifestly more money than was on hand would be needed, hence on April 10 the members were billed for their second assessment. . . .

As to complaints, except in a few instances, nothing has been brought before the committee that was explicit. The air is always charged with rumors, but vague complaints, while they signify a great deal, do not furnish anything tangible for a committee to follow up or investigate. We have had some specific charges which have been explained to the best of the ability of the respondent, and while they have not been entirely satisfactory to the committee, through assurance of their not occurring again, they have been overlooked. . . .

The committee have arranged for the publication of the proceedings of this convention in souvenir form, similar to that issued in 1892. . . . .

At our Boston annual meeting our membership list was increased to the number of 300. During the year the various locals have shown losses and gains as follows:

	1892.	1893	Gain.	Loss.
Number of Members.				
Albany and Troy	14	..	..	10
Buffalo	7	9	2	..
Chicago	17	38	21	..
Cincinnati	..	5	5	..
Cleveland	7	6	..	1
Denver	8	9	1	..
Joliet	..	6	6	..
Massachusetts	63	35	..	28
Michigan	..	30	30	..
Milwaukee	7	8	1	..
New York City	17	18	1	..
New Hampshire	14	10	..	4
Philadelphia	10	8	..	2
Rhode Island	..	7	7	..
St. Louis	10	9	..	1
Twin City	23	20	..	3
Spokane	..	5	5	..
Miscellaneous	29	31	2	..
Totals	..	..	81	49

Of the 28 names missing from the Massachusetts Local, four are still members of the National, having been transferred to the Rhode Island Local, which had not been formed at our last convention. Of the four less in the New Hampshire Local, one has been numbered among the dead, J. E. Noyes of Whitefield, N. H.

Five of the names taken from the miscellaneous members will now be found in the new locals formed this year, and eight have withdrawn entirely, showing 14 new miscellaneous members, and a gain of one in the present list over last year, remembering that eight have withdrawn entirely and five were transferred to new locals. Since our list was printed we have a new miscellaneous membership, that of Thomas W. Gannon of Cairo, Ill. Also three new names to add to our Chicago Local—viz.: Kehm & Mertz, J. M. Hogan & Co., Chicago, and A. J. West of Fernwood, Ill

We certainly have had much encouragement this year in the formation of new locals, some of them having promised to add still more names.

First on the list is the Cincinnati branch, formed through the instrumentality of one of our vice-presidents, H. D. Crane. The reports from him at this writing hold the promise of additional members later on. This action took Mr. Crane's name from our miscellaneous list.

The next in alphabetical order is the Joliet Local, which took the names of the Barrett Hardware Company and Messrs. Strong, Bush and Handwork from our isolated list.

In Michigan, largely through the instrumentality of Charles W. Light of the Eureka Heating & Ventilating Company of Saginaw, we have a new State local numbering 30 members. Mr. Light's name will now be found in this local instead of among the isolated members, as formerly.

The Rhode Island Local, through the influence of four former members of the Massachusetts Local, formed an organization, taking the name of the State. Their numbers consist of seven firms, three of them being new members.

Next in order is the Spokane Local consisting of five members, formed through correspondence with J. H. Griffith of the Griffith Heating & Ventilating Company.

. . . . .

As a personal privilege I desire you to indulge me a moment while I refer to my connection with this organization.

If I intend to be honest in the interests of the associations it is just as truly my duty to study my relation to it, and with it, as anything else I can or may do. It is now one month over four years since I began to organize it. In that time I have had occasion to be firm in giving directions that I believe to be right, and dispute with members, with non-members and with some sellers of goods. And even later on if these same parties changed their minds and became of my way of thinking, which if I proved to be right they would ultimately do, they have not forgotten, neither do I expect they will forget, the differences we had, even though they were slight.

I will confess that if one manufacturer hangs up a sign in his office, "Goods Sold Only to the Trade," I have been more inclined to tell him to hang up two than I have to urge that he take the one down. By following this course, however, I might be charged by those opposing such a policy with seeing but one man.

I do not care to dwell upon this subject, but refer to it with the suggestion (which is something of a chestnut) that new timber, against whom no one is prejudiced, could do more for the association perhaps than can be achieved by me under the circum-

stances. You need an efficient secretary, and in order that he may meet with success he must have the hearty support of each and every member.

The secretary's report was well received by the convention, who then listened to the reading of the Executive Committee's report, which is as follows :

Report of the Executive Committee.

Two reports having preceded ours, there is but little room or necessity for us to undertake any pleasant expressions of congratulation. Of course, even when omitted, such civilities are understood and accepted, at least in this case they are intended in the fullest and broadest sense. The Osborne cases, as reported by the secretary, contain all the knowledge that the Executive Committee have of the situation excepting as to the moneys received and disbursed, and they are looking forward to the report of the Committee on Legal Questions with the same interest as the balance of you.

We are pleased to notice that nearly all our locals have increased in number. The growth of our own local (Chicago) this year has been unprecedented and unlooked for. We believe, however, we are safe in making the claim that our members are very firm in their present attitude, and we are convinced that anything that may arise will have a tendency to increase their determination to remain united, rather than to swerve them from the paths they are now traveling in. The new locals taken in (five in number), already mentioned in the secretary's report, is an encouragement that is fully warranted. When one or two years more of a similar increase have accrued to us, we can begin to feel that we are maturing into what will eventually effect all that those who are in any way conservative can desire. We have an encouraging increase this year of 31 new members, many of them being firms whose names have appeared upon our books before. This is especially gratifying and leads us to the belief that some who have permitted their memberships to lapse in 1892-93, will return to us again later on.

The explanation by the secretary of the meeting of the manufacturers and sellers and a committee of master fitters of Chicago, at the national headquarters last fall, to better the trade relations as to classification, &c., suggests to us that there is room in this line for some good thought and work at this meeting. Is it imperative that our trade should be divided like all others into the proper classification of wholesalers and retailers ?

A committee should be appointed to consider this question. The radiator man's remark to the secretary, that if he had sold goods to the consumer at cut rates he would have done it so well as to insure his not being caught, should be something of a pointer to the above committee. What would be the result if every master fitter would, where practicable, buy his goods of the jobber instead of the manufacturer ?

Such a proposition at first thought to the large buyers, whose purchases run up into the hundreds of thousands of dollars, would be objectionable. The jobbing fraternity in our line now are strong and have large capital behind them and many dollars in view that they do not intend to neglect to try and get. Would buying our goods of the latter eventually bring every consumer to our doors for his supply ? Would such a policy extend our acquaintance and augment our business ? Would the jobber thus increase our opportunities by referring the consumer to us.

The committee have not had many irregularities to deal with this year, and have had but slight trouble with what has been brought before them, parties seeming to be willing to do what is right in each and every instance, which we account for from the fact (as said by the secretary) that they are learning that maintaining a consistent discount is just as healthy for them as for us. Our contract with the Henry O. Shepard Company to issue our souvenir we consider very reasonable, and we have the assurance from them that it shall be equal in every respect to the very handsome one issued last year by the Boston Executive Committee. We notice that from year to year our membership has had a steady and promising growth, 1892 and 1893 being even more encouraging than the former years, and the committee, we can assure you, feel exceedingly satisfied over the situation. So far as any information has been received, we have lost but one member by death during the past year, Mr. J. B. Noyes of Whitefield, N. H. In order that this sad event may be suitably remembered, we recommend that a committee be appointed to draft a resolution expressing the sorrow and sympathy of the association. Undoubtedly individual members have questions of importance in mind that should be offered here for consideration. We hope they will be prompt in presenting their beliefs or conviction, that they may be duly deliberated upon, and referred to a committee if necessary. It is well to remember that the postponement of any question until nearly time for adjournment is dangerous.

While we find from past experience that it is almost unnecessary to call the attention of any of the various committees to matters that may be referred to them, it might be well to suggest at this time that the Committee on Constitution and By-laws be appointed early in the session, and that they consider carefully the revision thereof. We desire to remind those present that this convention is held under peculiar conditions, the World's Fair attractions being a great incentive to neglect the work necessary to be attended to. We earnestly hope all will urge the most careful attention to business interests first, remembering that the consciousness of labors well performed will add greatly to the zest of the pleasures to come later. Another long year must intervene before we can again come together in a body, and we should not allow any important matter to suffer for lack of adequate attention, however much we may desire to hasten our deliberation. Hoping that not a single important feature will be overlooked, and that not one injudicious or unwise step will be taken, and thanking you for the honors conferred, we leave in your hands the situation.

Committee on Standard Flanges.

Chairman Edward P. Bates (Syracuse) of the Committee on Standard Flanges made his report. The committee had been working in harmony with a committee appointed for the same purpose by the American Society of Mechanical Engineers. Mr. Bates complimented the latter committee on their efficiency. Enlarged copies of tables and diagrams, used for the purpose of illustrating the subject by the Committee of Mechanical Engineers, were tacked upon the wall. The schedules adopted were the work of the two committees. A sketch of a 4 inch flange, full size, was shown. The schedule of sizes, strength, number of bolts, &c., given in connection with this sketch, is believed by the committee to cover all sizes and strengths used in ordinary construction. The committee suggested that, if a standard is adopted, the manufacturers should drill valves when putting them on the market. It would be an advantage to everybody and particularly to the steam fitter.

Mr. Walworth of Boston supported Chairman Bates, and set forth additional arguments for the adoption of standard flanges. He uses the Davis & Farnum formula in the absence of a general standard, preferring to send out work ready drilled rather than to have it finished by hand on the ground.

Mr. Bates then read the report of the Committee of Mechanical Engineers on Flange Standardization, made through its chairman, C. W. Nason, at the meeting of November 29 to December 2, 1892.

A discussion followed, in which practical questions were asked and answers were given by Chairman Bates.

The report of the committee was accepted and the suggestions were adopted by a unanimous vote.

Mr. Bates urged all members to get copies of the standard and live up to it, specifying it so that manufacturers will comply with the measure thus approved by the association.

Mr. Crane of Cincinnati moved that the Executive Committee be instructed to have schedules printed and copies sent to all manufacturers, which was unanimously adopted.

List of Members.

The Committee on Credentials reported that 84 persons were present or reporting to the committee, as follows :

NEW YORK.

J. Leland Wells, Wells & Newton Company.
Chas. J. Gillis, Gillis & Geoghegan.
H. J. Barron, Barron Steam Heating Company.
A. C. Mercer, H. B. Smith Company.
E. D Smith, Boker, Smith & Co.
W. S. Phillips, Phillips, Doup & Co.

SYRACUSE, N. Y.

E. P. Bates.

CAIRO, ILL.

Thomas W. Gannon.

WILKESBARRE, PA.

Peter Forve & Bro.

BUFFALO, N. Y.

J. Irlbacher, Irlbacher & Davis.
Chas. Geiger, Barud & Geiger.
Chas Geiger, proxy for Clark & Co.
John W. Danforth.
Lewis W. Gay, proxy for J. H. Ruckel & Co.
E L. Cook, Whitte, Barrett & Co.

MASSACHUSETTS.

John F. Buerkel, Buerkel & Co, proxy for Ingalls & Kendricken, Daniel Russell, Bosworth & French, Le Bosquet Bros., Smith & Anthony Stove Company, A. A. Sanborn, Nutter & Seabury, W. A. Folsom & Co., John B. Farnsworth.
A. F. Kenrick, Kenrick Bros., proxy for Koehler Furnace & Steam Heater Company, Anthony Adams, Wm. Costello, G. M. Parks, H. E. Jennison, S. C. Higgins, J. R. Morrison, P. W. Swan & Son, W. H. Gallison, F. W. Foster, Lynch & Woodward, Richardson & Clement.
Albert B. Franklin, proxy for Thayer Heater Company, A. Descalzo, W. W. Heath, and Wm. E. Bartlett.
A. C. Walworth, Walworth Construction & Supply Company.

CHICAGO.

L. S. Daniels, Boynton Furnace Company.
George D. Hoffman
C. H. Simmons, Theodore Jaoobs Company.
F. W. Lamb, F. W. Lamb & Co.
G. E. Dixon, Goulds & Coldwell Company.
John Woodman.
John Davis, John Davis Company.
H. A. Kroeschell, Kroeschell Bros.
C. C. Finkler, Illinois Heating Company.
E. J. Yunker, D. F. Morgan Boiler Company.
P. S. Hudson, Baker & Smith Company.
Samuel I. Pope, Samuel I. Pope Company.
L. H. Prentice, L. H. Prentice Company.
James L. Cook, Cook & Chick.
D. M. Quay, Wells & Newton Company.
W. D. O'Brien.
E. McDonough.
W. A. Leach.
M. Cragin.
Kelly & Jones Company.
F. W. Herendeen of Herendeen Mfg. Company, Chicago.

CINCINNATI.

H. D. Crane, M. H. Crane estate.

ST. LOUIS.

John B. Hughes, St. Louis Steam Heating and Ventilating Company.
W. X. Sweeney, Missouri Steam Heating Company.
John J. Collins.
E. M. Bosley, Globe Heating Company.
Mepham Heating Company.
J. H. Davis, American Heating Company.

CLEVELAND.

John Becker, Chafer & Becker.

DENVER.

C. J. Reilly, proxy for H. W. Michaels.
J. T. Bradley.

TWIN CITY.

Wm. Rodger & Co.

MILWAUKEE.

A. J. Lindeman, Lindeman, Hoverson & Co.
M. Coogan, M. Coogan & Co.
Chas. B. Kruse, Kruse Steam Heating Company.
J. Grassler, Grassler & Gezelschap.
J. Cordes, Cordes & Treis.
W. Lowman, Davis & Lowman.
W. K. Downey, H. Moore & Co.
W. K. Downey, proxy for Henry G. Sohns.

MICHIGAN.

Chas. W. Light, Eureka Heating & Ventilating Company.
Julian S. Leet, Michigan Heating Company.
Robert Sproul, Sproul & McGurrin.
John A. Wheeler, Wheeler & Pitkin.
J. O. Galloop.

BURLINGTON, IOWA.

W. O. Ewinger, Henry Ewinger.

PHILADELPHIA, PA.

W. P. Thompson, Thompson Bros.

APPLETON, WIS.

W. S. Patterson, W. S. Patterson & Co.

PITTSBURGH, PA.

Wm. J. Kelly.

JOLIET, ILL.

Geo. Poehner of Poehner & Dillman.
Geo. W. Strong of Strong, Bush & Handwerk.
H. Ford of Ford & Kelly.
E. C. Barrett of Barrett Hardware Company.

CLEVELAND.

Mr. Dewstoe of Dewstoe & Schneider.
J. McWilliams, Louisville, Ky.
W. C. Weatherly of Macaulay Bros, Grand Rapids, Mich.
Wm. J. Kelley, Pittsburgh.

Proxy sent to P. S. Hudson for E. D. Hornbrook, Kansas City.
H. A. ft. Dietrich, Bethlehem, Pa.

Treasurer's Report.

The treasurer's report was presented by F. W. Lamb, a summary of which is as follows:

Receipts for the year	$9,555.30
Disbursements	8,309.84
Leaving a balance of	$1,245.46

TUESDAY AFTERNOON SESSION.

An adjournment was taken to Uhlich's Hall, Clark and Kinzie streets, to secure more room than was afforded by the hotel parlors.

The first business taken up was the appointment of special committees. The president appointed the following:

Committee on Constitution.—Messrs Wells of New York, Franklin of Boston, Prentice of Chicago, Crane of Cincinnati and Walworth of Boston.

Committee on Appeals and Grievances.—Messrs. Simmons of Chicago, Kenrick of Boston and Bradley of Denver.

Committee on Good of the Order.—Messrs. Thompson of Philadelphia, Smith of New York and Woodman of Chicago.

Committee on Ways and Means.—Messrs. Buerkle of Boston, Hoffman of Chicago and Gillis of New York.

Committee on Amalgamation with Plumbers.—Messrs. Giessner of Milwaukee, Sproul of Grand Rapids and Quay of Chicago.

Committee on Death of G. E. Noyes — Messrs. Franklin of Boston, Barron of New York and McDonough of Chicago.

Committee on Wholesale and Retail.—Messrs. Woodman of Chicago, Light of Saginaw and Becker of Cleveland.

The roll was then called by States for reports from members having resolutions to offer or changes to recommend in by-laws. At this juncture a motion prevailed to go into executive session, at the conclusion of which an adjournment was taken until Wednesday morning.

WEDNESDAY MORNING'S SESSION.

After a brief executive session, during which some of the special work of the convention was laid out for consideration and future report, the doors were thrown open for the reading of papers. Charles J. Gillis was first called on, who read a very interesting paper on

Trade Schools and Charity.

"Knowledge is power" is an axiom which has been heard around the world since the dawn of civilization, and is as true now as it ever was, only that by the lights of modern times, it may be added that knowledge and money united make the greatest power wielded by man, an Archimedes' Lever, by the use of which the world can be moved, mountains leveled, great rivers spanned by mighty bridges and railroads and electric wires laid down all over the world.

Thothmes III, the great king of Egypt, who reigned thousands of years ago and elevated Egypt to the highest pinnacle of glory, whose immense statues and monuments may still be seen scattered all over that country, conquered the then known world, because he had knowledge of the art of war and a vast treasure to call upon.

I propose in this paper to suggest how knowledge may best be obtained, treasure accumulated, and some suggestions as to what is best to do with the latter when people have a superabundance.

PUBLIC SCHOOLS.

The public school systems of this and some other countries are admirable, and there is nothing for which the public pay taxes more readily. In the city of New York there are over 100 school buildings, many of them large and splendid specimens of architecture, with all modern appliances for making easy the paths to knowledge. There are always near 150,000 children attending these schools. I think there should be added to the public school systems all over the country two methods of teaching: The kindergarten for little children under six—now largely done in Boston, Chicago and San Francisco; and trade schools; but until instruction, both theoretical and practical, is given in various trades in public schools, dependence must be had upon the munificence of individuals for their establishment and largely for their maintenance. This has been done in the city of New York by Col. Richard T. Auchmuty in the schools established by him 12 years ago, which have been in successful operation ever since. Mrs. Auchmuty gave the grounds on which the school buildings are erected at First avenue and Sixty-seventh and Sixty-eighth streets, valued at $500,000, and last year J. Pierrepont Morgan added to the fund $500,000 more. The institution is not a self-sustaining one, the expenses last year having been $10,000 more than the receipts; nor is a profit sought by the promoters, their aim being to help young men learn good trades. The closing exercises of the school took place April 7; the course began October 1; the trades taught having been bricklaying, plastering, plumbing, carpentering, house painting, fresco painting and blacksmithing.

Total attendance has been 475; cost of tuition, from $12 to $30 per course. The day schools have been attended during the past season by young men from 32 States of our Union, from the District of Columbia, New Brunswick, Prince Edward's Island, Nova Scotia, and the Provinces of Ontario and Quebec in the Dominion of Canada.

NEW YORK TRADE SCHOOLS.

The promoter of these schools says: "Instruction in the mechanical arts other than that which could be had in a workshop, was regarded in this country as of little promise when the New York Trade Schools were established. The value of such instruction has now been proved, and there has hardly been a convention of master mechanics during the past four years at which the necessity of more systematic instruction in the trades than can be given in a workshop has not been admitted. This result has been brought about by the thoroughness of the instruction, both manual and scientific, which the New York Trade Schools have shown a trade school can give."

The New York Trade Schools are conducted on the principle of teaching thoroughly how work shall be done and leaving the quickness which is required of a first-class mechanic to be acquired at real work after leaving the schools. Progress at a trade school is necessarily rapid, as it is constantly sought to ascertain not only what the pupil knows, but in what he is deficient. Such a system can rarely be pursued in a workshop, where such employee is necessarily employed upon the work he can do best. Full wages have usually been obtained in from six months to two years after leaving the New York Trade Schools, according to the nature of the trade and the age of the pupil. Young men who were exceptionally quick at learning have obtained full wages at once; but it is the opinion of the management that steady work is more profitable in the end than high wages.

Trade schools are not a new thing. They have been established a long time in Europe, and partially for some years in this country in many colleges and institutes, but generally combined with general education, which does not meet the wants of young men who must support themselves and contribute to the family support.

It is expected that during the coming season an annex to the New York Trade Schools will be provided and a course of instruction, scientific and practical, will be given in the principles and practices of heating by steam or hot water in all its branches. Such a course of instruction cannot fail to be of incalculable importance to the master steam fitters, as well as to the steam fitters and helpers. Steam fitting business is of comparatively recent date, the writer having seen the first steam heating coil soon after it was erected in this country in 1835 by the late Joseph Nason; now there are millions of dollars invested in the business and hundreds of establishments whose sole business is the erection of steam and hot-water apparatus. The establishment of better methods for teaching steam heating seems to be a necessity.

ACCUMULATIONS OF WEALTH.

The possession of large accumulations of property in the hands of bad men is a menace to the State and should be prevented by due process of law, such a law as has existed in France since the time of Napoleon I, by which a man when he makes a will must divide his property, with some exceptions, among all his children, share and

share alike. In consequence of this law there are now in France 5,500,000 land holders, making the people of France, considered as individuals, the richest people on earth, and enabled the Government to astonish the financiers of Europe by paying at once the $2,000,000,000 of indemnity demanded by the Germans at the close of the war of 1870.

There are in this country, according to the latest statistics, 4047 millionaires, many of whom count their possessions at $50,000,000 or $100,000,000 each, and some have discovered, apparently, of late years, first, that sooner or later they are going to die; and second, that if they make a will it is more than likely to be broken and their money go in the directions they had not contemplated and do not wish. Therefore, we now oftener see men following the advice of Andrew Carnegie, giving away their surplus while they are living in order that they may have personal supervision over the spending of it. These give largely to charity, with the result seen everywhere in Christian countries of noble institutions for the poor, the blind, the helpless and the sick. Charity is great, good, noble, Godlike, for it is taught by the great Master Himself, and everywhere his followers are largely governed by these teachings.

There is in the city of New York an institution called the Woman's Mission, where poor women can come at any time, night or day, and be furnished, free of cost, with a hot meal and a bed and given every assistance and help.

The institution is supported by some of the wealthy ladies of the city. One of them, known as Sister Augusta, was often there evenings entertaining the women by her fine musical talent, speaking to them, cheering and encouraging them in every way that could be thought of. Little did these poor women know that this sister Augusta was the wife of the richest man in America.

Another of the grand ladies of our city built an annex at large expense to a public hospital where ladies of refinement and delicately reared could have the services of the best surgical aid if necessary. One of the first to avail herself of this privilege was a young girl. The lady who built the hospital saw much of her and they became tenderly attached. By one of those extraordinary coincidences which sometimes take place, the lady herself had to have the services of a surgeon, and instead of being attended to in her own luxurious home, she went to the hospital, saw the young lady, who threw her arms around her, and said: "We will have these operations done in different rooms at the same time and if we do not survive will go together." It was done. The younger passed away, but the elder survived. It is not difficult to understand that the angels of heaven looking down from above should say, "There is no occasion for us to come on earth, for they and such as they are doing our work there."

OPPORTUNITY NOT CHARITY.

In a far-off country I lately stood near an ancient palace at Delbi, India, on the banks of the river Ganges. A native was lying there on the sand in the agonies of death, the hot sun pouring down on his uncovered head. They told us he would soon die and his body be thrown into the river. There was no hospital there, no Sister of Charity.

But the stalwart sons of America will have no charity. What they want and should have is an opportunity to work and gain a knowledge of some business or trade which will give them an adequate return for their labor. This can but be done by the establishment of trade schools, and I hope that the attention of the wealthy men of the country may be called to the importance of establishing them; for certainly the good that can be accomplished by them is second only to the public-school system. I hope the time is not far distant when the mechanics themselves shall demand that no one be allowed to work at their trades unless he can show a certificate of graduation from a trade school, same as is now required of doctors and lawyers, as in most countries they cannot practice their professions unless they can show the previous preparation of education in medical or legal schools. Great as would be the results of the establishment of trade schools, if men will not avail themselves of their privileges and attend them, there will be no good results. As a poet has written about a great country:

"Fair Greece! sad relic of departed worth;
Immortal though no more; though fallen, great!
Who now shall lead thy scattered children forth?
Know ye not
Who would be free themselves must strike the blow?
By their right arms the conquest be wrought!"

Yes; by their right arms, by their own exertions, men must win their way.

Let us, therefore, men and brethren, implore the young men who come within our influence to be equal to their opportunities; to be first of all patriots, to swear by the flag of their country; for all who stand beneath its folds are entitled to "Life, liberty and the pursuit of happiness;" to gain a knowledge of their business; to be sober and attentive, and then they will be an honor to their kindred and their country, and when the time comes for them to join the numberless hosts who have passed away, they may have engraved on their tombstones: "He was a scholar, a Christian and a gentleman."

A discussion on this paper arose on the subject of the recognition of training schools by trade unions, in which statements were made that the opposition once existing is giving way gradually in numerous trades. The matter thus far has caused no trouble in the steam heating trade.

A. C. Walworth of Boston next read an exceedingly entertaining historical paper written by his father, J. J. Walworth, on

The Early Days of Steam Heating.

At the convention last year a vote was passed asking James J. Walworth of Boston to read an historical paper at the convention of 1893. Owing to various circumstances Mr. Walworth is not able to be present, but I am glad to read this paper in response to your kind invitation, and you will please to consider it collated by James J. Walworth, and simply edited by myself. For the benefit of those who were not at the convention last year, and in order to make this paper complete in itself, some facts given last year may be herein repeated.

There is no question that the store 36 Ann street, New York, was the birthplace of the steam-fitting business in this country. It was in that store that James Boyce, an Englishman, placed on sale a small stock of butt-welded pipe, 2-inch diameter and under, in addition to some other articles which he had brought over from the Old Country, no pipe being then made in this country. This stock was bought by Mr. Walworth in June, 1841, after correspondence with Joseph Nason, who was then in England, with the idea of both dealing in pipe and constructing the Perkins hot-water apparatus. Mr. Boyce then left for home, but Gardner D. Hiscox, his clerk, remained at the New York store for some time. Mr. Walworth carried on the business until 1842, when Mr. Nason returned, and the firm of Walworth & Nason, so well known to the last generation, commenced its active existence. Both Mr. Walworth and Mr. Nason belonged in Boston, and they naturally considered that city a good field for putting in heating apparatus, so they arranged to rent the store 18 Devonshire street, built especially for them, and in June, 1842, began business.

FIRST PIPE MAKING.

It may be remarked that at this time no pipe was made in America. Mr. Walworth was told by Joseph McCully, who was superintendent of Morris, Tasker & Morris' Tube Works, and by John Russell, who claimed that he drew the first tube ever made, that these tubes were not made until 1842, or later, and the Exeter, N. H., mill was not started until 1847.

To return to the New York business: This was moved from 36 Ann street to 149 Platt street, May 1, 1844, two days after the birth of the reader of this paper, and just three years later to 79 John street, the identical store now occupied by Felix Campbell in the same business. In this store Mr Campbell will be glad to show any caller a space about 15 feet long on the wall near the door where he says was kept all the pipe then in New York City, he himself having been an apprentice in the shop at about that date.

In the autumn of 1842 Walworth & Nason put in their first heating apparatus of the Perkins hot-water type, at the counting room of the Chiddlesex Company of Lowell, Mass. The boiler of this and subsequent apparatus was simply a circular coil of one continuous tube, such as Mr. Baker afterward adopted in his car heater, which is nothing more nor less than a Perkins apparatus adapted to a railway car. Although Mr. Perkins' practice was to use no valves, Mr. Nason found that in dwelling house apparatus it was better to divide the radiation into several sections for the various rooms to be warmed. He consequently devised a stop cock of a peculiar construction, with a stuffing box, not intended to make a perfectly tight closing of the circulation, but tight enough to reduce it to a minimum, so that the temperature of each room could be regulated independently. This arrangement thoroughly effected this, but both Mr. Walworth and Mr. Nason thought it not quite safe to construct an apparatus in which all the surface might be shut off at once, so they decided to discontinue that type of apparatus and place all the heating surface in a chamber or chambers in the basement, with the warm-air pipes leading to the several rooms, or precisely the indirect apparatus of to-day.

Such an apparatus was placed in the house of the late Ebenezer Milliken, 15 Ashburton Place, Boston, probably in 1845, where it is still in successful operation.

SMALL PIPES FOR STEAM.

At about this time Mr. Nason conceived the idea of using small pipes of ¾ or 1 inch diameter for heating by steam, in place of the large cast-iron pipes then in use in England and in a few mills in this country. About March 15, 1845, W. & N. contracted to put into the Eastern Exchange Hotel, near the East Boston Ferry, the first steam apparatus in the world using small wrought-iron pipe. On April 7, 1845, Mr. Walworth went to Burlington, Vt., to plan the warming and other steam apparatus for the Burlington Woolen Mills, the first large apparatus of this kind. On September 9 he started a similar apparatus in the Manchester Mills. Two days later, on September 11, the apparatus in the hotel above mentioned was tested and worked perfectly. On September 12 a similar apparatus was begun at the Eagle Screw Company's building at Providence, R. I., and during the same year Fletcher & Bro.'s cotton mill was piped in that city.

The year 1845 also saw the first globe valve devised and made by Mr. Nason, substantially as made by the million to-day.

The next year, 1846, saw the construction of steam apparatus, among others, for the Naumberg Mills, Salem; a five-story mill in Providence, for the Portsmouth Mills, six stores, for the Fall River Iron Company's cotton mill, the Lowell Company's mill, Blackburn & Co.'s mill in Ashburnham, for Stephen Fitch's mill near Norwich, Conn., for the Manchester Print Works, for the American Tract Society's building in New York, and for the Boston Custom House.

This last apparatus deserves special mention as being the first to use a fan blower in connection with an indirect coil. The apparatus was entirely successful and afforded an ample supply of fresh air and heat. In it the exhaust steam for the engine was used for heating the entering air as well as direct steam.

This apparatus was used nearly 30 years ago. At the end of this time, since small pipe was used in the coils and mineral oils for engines had not come into use, some of the coils became clogged with the gum from the oil, and under the administration of Mullet it was easy to have the whole apparatus condemned in order to give an opportunity for a new "job." This was done, and the apparatus was replaced by another without a fan, and, as I am told by experts, one very inferior to the old one, and one which is soon to be removed on account of its defections and bad condition.

FORMATIVE PERIOD.

The formation period of this business, including the first ten years, from 1841 to 1851, was the one which required and actually developed more skill and wise foresight, more energy, genius and creative power, than has ever been exhibited or called for since.

For them at the beginning there were no precedents, no examples of work, no experienced workmen in this new system, no tools adapted to the work. There were literally no fittings suitable for the new work. But after ten years of patient study and energetic work, among other things a complete set of cast-iron fittings had been designed and made; also a complete set of malleable-iron fittings (no fittings of either

cast iron or malleable had ever been made before). Special tools had been made, workmen had been trained, hundreds of factories and other buildings had been fitted up with steam heating apparatus. The first horizontal tubular boiler had been designed and brought into use. The fan blower for ventilation had been introduced. The finest tube works in the country had been built, and a great variety of special articles had been invented and brought into use, and more than all, reputation and public recognition had been gained.

After all this the growth of the business should have been comparatively easy.

The momentum gained in these ten years of energetic push became a chief factor in the future growth of the business. Only poor management or unavoidable misfortune could prevent prosperity.

It should be noted that cast-iron fittings were used from the first by Walworth & Nason, who discarded the wrought-iron fittings from England ten years before Mr. Kendricken thought he saw them being made at 18 Devonshire street in 1852. Mr. Walworth states that no wrought-iron fittings, except R and L couplings, were ever made in that shop, and as early as 1845 that firm were paying $5000 a year for castings to one foundry. At this time all the patterns for tees, elbows, branch tees, hook plates, return bends, &c., had to be devised, proportioned and made, and this work was done by Joseph Nason.

THE PIONEER OF STEAM HEATING.

Of the original work of Mr. Nason in this direction, the late Robert Briggs, C.E., in one of his reports says truly, "The steam heating apparatus in all its details, as used in America, especially the apparatus of small wrought-iron tubes, which had its origin at the hands of the late Joseph Nason between 1840 and 1850, has now become one of the established industries of the land, employing a whole class of workmen known as steam fitters and supporting large establishments devoted entirely to the manufacture of and trade in tubes and fittings. The little step in mechanism which is the foundation of this art is found in the use of the tapering thread on the end of the pipes wherewith a perfectly stanch joint is provided and made. It was not only in this particular but in many others of detail that Mr. Nason's ability as an inventor and adapter was shown in the apparatus; while supereminent above this he was at once the best informed man of his day on the theory and the most able in the practice of steam heating. Under his tuition the whole trade originated; not many years since it was possible to trace the descent or pedigree of any concern in the business to the original source. At this time the growth of the business going to a third or fourth race of firms or of workmen, precludes the following out of the continuity, although it certainly exists. The business, however, has been and is dependent upon the development of mechanical ingenuity, mainly from Joseph Nason, who gave form to the globe valve and derived or adapted from the practice of hot-water heating apparatus in England all the essential details which now form parts of usual every-day construction in the United States. Curiously, steam heating as practiced here is not yet fully known or used in England or France and but little more known in Germany.

FOREIGN MANUFACTURE.

In 1847 Mr. Walworth sailed for Europe to obtain information about two mills, returning in September, bringing plans and working details for a plant for manufacturing pipes and tubes. The Waualancet Tube & Iron Company were incorporated, with a capital of $150,000; a pipe mill was built at Edgeworth, near Boston, which was at that time the largest and best appointed in the United States. During 1850 and 1851 pipe was made in considerable quantities, but at the end of that year financial embarrassments, owing to insufficient capital and stringency in the money market, compelled their suspension. This involved the firm of Walworth & Nason, and resulted in the separation of the Boston and New York houses—Mr. Nason going to New York, and the Boston firm became J. J. Walworth & Co. It was not long after this that the White House at Washington was furnished with a hot-water apparatus by Mr. Walworth. It seems that Col. Chas. G. Greene, editor of the Boston *Post*, was in Washington when the White House was being put in order for the newly elected President Franklin Pierce. The heating of the house had always been execrable; there was one cold corner in particular which General Jackson graphically declared that hell itself could not heat; the question of what should be done was under discussion in the presence of Colonel Greene. He told the commissioners, of whom Capt. T. J. Lee was chairman, that he knew a man in Boston who was ahead of the rest of creation on that subject, and Captain Lee said: "send for him." Mr. Walworth was summoned to Washington at once, going on March 23, 1853, and a contract was made and closed June 1; amount, $7000. A large indirect hot water apparatus was put in before fall, and gave perfect satisfaction.

A paper of this kind should not omit, even at the risk of repetition, to recapitulate what great steps in advance were made between 1840 and 1852, through the inventive energy of Joseph Nason and the business energy of James J. Walworth, who also added mechanical genius competent to design and carry out large and successful heating contracts after he was deprived of Mr. Nason, collaborative with the removal of the latter to New York, including in this category many large insane asylums, like that at Augusta, Maine, and the City Hospital, Boston, which in all their designs and details were engineered by Mr. Walworth.

SOME STEAM SPECIALTIES.

Before 1852 Walworth & Nason had invented and placed on the market the steam trap, the globe and angle valve, the check valve, the back-pressure valve, the scroll die plate; also, the use first of cast-iron and later of malleable-iron fittings instead of forgings, and the horizontal tubular boiler with small tubes. Beginning with almost no capital in 1841 and working without appreciable profit for several years, after 1846 the business had so increased as to show annual profits of $25,000 for several years, the sale of pipe alone being $100,000 per annum, while before 1850 they were running 15 lathes on cocks and valves, five on valves alone, which they had been making since 1845, although one gentleman thought last year that he saw Mr. Barrett "shaping" the first one in 1852. Before 1850 Walworth & Nason had completed contracts aggregating hundreds of thousands of dollars, sold millions of feet of pipe and many tons of fittings, both cast iron and malleable, and placed the whole business of steam fitting on a standard basis, so that their employees were able to go out and start in the business for themselves with all the necessary devices, valves, fittings, pipe and tools ready at hand for purchase.

The reading of this paper was prefaced by explanatory remarks, in which Mr. Walworth gave some historical facts regarding the evolution of approved methods of pipe threading and coupling, as well as other points in steam-fitting practice now in general use.

T. J. Barron of New York followed next with a paper, partly reminiscent and partly prophetic, entitled "A Look Ahead," which we hope to present to our readers in an early issue. Mr. Barron's paper was received with enthusiastic applause.

L. H. Prentice of Chicago then read a paper, which was well received, entitled

Brotherly Love.

When invitations were sent out to the members to prepare papers to be read at this convention it did not occur to me that I could say anything that would interest you, but at the earnest solicitation of Brother Reynolds I consented to try, and will take my text from the fifteenth chapter of the Gospel according to St. John, and the seventeenth verse, which reads, "These things I command you, that ye love one another."

This commandment may seem rather difficult for some of you to obey, you who have always considered your competitor your enemy instead of your friend, but let me tell you that it will be dollars in your pocket if you will get this idea out of your heads, disabuse your minds of the error that it is necessary to ruin everybody in the same business by underbidding them in trying to get all the contracts in sight, and by criticising their work, their credit or their character.

My connection with associations of steam fitters dates back 10 or 12 years, and I think I was one of the first of a small band of "conspirators" (as they call them in St. Louis) who got together to see if something could not be done to better the situation. At that time we scarcely knew one another when we met in the street, nor did we care to, for we considered that we were natural enemies. This condition of mind made us easy prey for ingenious patrons. If an architect or owner mentioned one of our competitor's names we would slash off another 10 per cent. from our bid.

Well, as I was about to say, we got together once or twice and found that, after all, we were pretty nice people, and that our supposed friends were deceiving us, so we formed an association for mutual protection, and resolved in the future to "love one another," instead of trying to break up each other's business.

I think if you will ask any of our old members they will tell you that a fraternal commercial policy pays. And what business is there to-day that does not have its associations? I do not mean trusts or combinations to put up prices; but organizations where you can meet, become acquainted, and so regulate trade that you will not be a constant menace and injury to each other or subjects of the business guile so frequently met with. This principle of co-operation, the formation of locals, and the holding of national conventions which brings us together, is worth thousand of dollars to you, and the beggarly sum you are called upon to contribute is money well spent. This idea that we are enemies should be gotten rid of, by assisting each other in every honorable way to get that which belongs to us—viz., a legitimate profit for our labor.

One of my oldest competitors and friends (now present at this convention), a man who is at the head of one of our largest firms in this business, also an officer of the National association, once said that he would never join an organization that would lift up his weak competitors, or small firms. But he has changed his mind, and you know Bob Ingersoll once said that a man who never changed his mind is a d——d fool. Now, my brethren, if any of you are of the same opinion, that by working together and helping each other you are injuring yourself, it is time to change your mind, and I hope you will resolve to do so before leaving this city.

I wish, in conclusion, to say publicly that I entertain the sincerest regard for every one of my competitors, and they cannot make any reasonable request of me that I will not cheerfully grant.

Furthermore, I wish to thank you all, especially each individual member of the Chicago Local, for their uniform kindness to me since we became better acquainted, and for your patience in listening to my first public effusion, which I hope will in a measure cause you to mentally resolve that in the future you will try to obey the words of the Apostle by loving one another, and by so doing benefit yourselves and do justice to your families as well as your patrons.

Geo. D. Hoffman of Chicago, followed with a very able paper on

Combination Heating.

In selecting the matter of combination heating as the subject of my discourse, I am free to confess that I did so with some misgivings. It is such a common fault, not only among heating engineers, but also among the other learned professions, to condemn that method or system which is foreign in its teachings from that particular system from which they derive their knowledge. Thus, the allopathic doctor condemns every move or treatment of the homœopathic doctor, and the Methodist minister claims that the Baptist minister is all wrong; that their particular plan is the only one that will insure salvation to the world-weary sinner, and yet the objective point with each differing school is the same; each doctor strives to cure his patient and each minister to save the soul intrusted to his teachings. It is only natural, therefore, with these precedents, that heating engineers should condemn almost unheard systems of heating which are outside of their particular line.

You, gentlemen, call yourself master steam and hot-water fitters, and there is hardly a man among you who will not take a contract for either steam or hot-water

fitting, and who will not acknowledge that each system has its particular merits, and each in its way is worthy of the careful consideration of any prospective buyer; and yet it is within my short recollection in this business when steam men declared war to the knife against hot-water heating, and the advocates of hot water were equally strong in their condemnation of steam. To-day there is hardly a man among you who does not and will talk against and condemn from every point the system of furnace heating. It is said that furnaces are dirty, dusty and unhealthy, because they admit smoke and gas into the living rooms. It is also said that a furnace burns the air, and that one side of a furnace-heated house is always cold, while the other side is too hot. Inasmuch as a combination heater is a combination of a furnace and a steam or hot-water boiler, it is necessary for me to defend the system of furnace heating against the calumny of its opponents. Taking the accusations—dirty, dusty and unhealthy—in their order:

SO-CALLED BURNT AIR.

It is a well-known fact that all systems of heating are dirty, and all systems of indirect heating are particularly so. The reason for this, as we all know, lies in the fact that dust is an ever-present quantity in air, although it may be imperceptible to the naked eye. Even in a darkened room, which is hermetically sealed to the influence of the outside air, the presence of dust is made discernible even to the naked eye by the admission of a ray of sunlight. This is the evidence of the unceasing changes which the material world is continually undergoing—the irrefragable proofs that the visible matter of the universe is slowly and almost imperceptibly passing through a series of transmutations which affect both organic and inorganic nature.

In all systems of heating, both direct and indirect, where air is brought in contact with heated surfaces, these minute atoms of animal and vegetable matter, which are carried suspended in the air, are charred or burned by contact with the heated surface of the furnace or radiator, as the case may be, and this gives rise very frequently to the opinion (more particularly so in furnace work than in steam or hot water) that we burn the air. Now, the air itself is not burned, as it is impossible to burn air without combustion.

I remember reading an interesting article several years ago in the *Scientific American*, in which an elaborate test was made of this very subject. Air was taken from one receptacle and passed through, between and over wrought-iron plates, which were heated to an intensity of 2000° F., and then passed into another receptacle; and after the air had sufficiently cooled it was subjected to a chemical test and found to contain all the life giving qualities that it had previous to its passage over these plates.

INDIRECT HEATING SYSTEM.

The theory of furnace, or any other system of indirect heating, is one of displacement—*i. e.*, all the air in a room or building to be heated by this method must be displaced by the warmer air from the furnace, and, as this air cools from contact with the cold walls and other surfaces in the room, it must in its turn be driven from the room by a further introduction of warm air from the furnace. With a sufficient number of open fire places, or other means of drawing off the cold air from the rooms, the flow of the air from the furnace or indirect radiator is continuous and natural, and if the supply of air to the furnace or indirect stack is from the outside, there is a continual flow of fresh dust as well as fresh air. As cheap, poorly constructed furnaces are not considered "in it" in this article, and as well-constructed furnaces do not leak gas, smoke or dust from their combustion chambers, the above argument against the furnace on account of its being dirty is the only one that will stand the search light of unprejudiced investigation. Very few blessings are unmixed with evil, and in my opinion the blessing of an abundance of fresh air more than offsets the evil of the accompanying dust.

DRY AIR.

The main argument advanced to uphold the statement that the furnace is unhealthy is that it drys the air, thereby inferring that the original moisture contained in the air before its entrance into the heating chamber of the furnace was lost by contact with the heating surfaces of the furnace. We also very often hear this same argument advanced against steam heating, but nothing can be further from the truth. Air when saturated with moisture contains, at 32° F., one-one hundred and sixtieth of its weight in water, at 50° it contains one-eightieth and at 86° one-fortieth, doubling its capacity for moisture with each increase of 27° F.

We can readily see by the foregoing that instead of losing the moisture, we have simply increased the capacity of the air for moisture with increase of temperature. If allowed to remain in this condition the effect would not only be deleterious to persons occupying the room so heated, but the effects would be disastrous on the furniture and the wood work of the room. It is a well-known scientific fact that rapid evaporation has a cooling effect, which enables one to withstand a much higher temperature without discomfort than would be possible in an atmosphere heavily charged with moisture. Thus we read every summer of numerous heat prostrations in New York, where the atmosphere is extremely humid with a temperature of not over 90° F., while in the high dry altitudes of some of our Western States a temperature of 100° to 110° in the shade is successfully withstood. In artificial heating a happy medium is the desideratum, and in all well-constructed furnaces ample provisions are made for supplying the extra moisture made necessary by raising the temperature of the air.

As to whether I have in the foregoing made a successful defense of the subject of furnace heating is a question which you, gentlemen, must decide upon. In any event I shall drop this subject at this point from now on, and simply treat of the main subject of my discourse.

THE COMBINATION SYSTEM.

The word "combination" may be defined as the result of combining or joining together two or more different elements or systems into one harmonious whole. There are several distinct and different systems of heating, and the combining of any two of these systems into one would naturally result in a combination system. The specific form of combination heating which I wish to treat of is obtained by a combination of steam or hot water and air, or, as it is commonly called, furnace heat. The advantage of the combination system in buildings suitable to its use are manifold, but in order that these advantages may be made apparent, it may be necessary to diverge a little. Heat is supposed by many to be an actual and discernible substance, and until within a very few years even the more advanced students of natural physics were of the same opinion. Later investigation has shown that heat is nothing more nor less than molecular motion, consisting in case of air of nearly uniform rectilinear motions, with sudden changes in direction and velocity when the molecules come too near one another; in case of a liquid of irregular wandering of its molecules, and in case of a solid of orbital or oscillatory motions. By the foregoing definitions it will be readily seen that air will absorb heat much more rapidly than either liquids or solids, and as in combination heating we are depending for fully 50 per cent. of our heat on air heat, the natural conclusion is that a combination heater will give results in the rooms to be heated much quicker than either straight steam or straight hot water.

Heat is communicated from one body to another in three ways, viz.: Radiation, convection and conduction. Radiant heat passes from one body to another at a distance through the air in straight lines and with great velocity, but it does not, to any appreciable extent, warm the air through which it passes. Conducted heat passes from one particle of matter to another at insensible distances, as an iron bar with one end in the fire becomes gradually heated at the other end. Convected heat is the movement of the heated body itself from one point to another, as the circulation of hot air or hot water. In combination heating we again have an advantage over straight steam or hot water, as we utilize in the rooms to be heated two of the three processes of heat distribution—*i. e.*, radiant and convected heat—while in steam or hot water only the radiant heat is utilized.

VENTILATION.

One of the most important features of combination heating is the fact that where the air supply is taken from the outside, as it always should be, it insures a perfect ventilation throughout the building, as well as heat. The necessity for ventilation is very little appreciated by the general public, but as heating and ventilation have always seemed to me to be inseparable, and as the people naturally turn to our profession for their knowledge of these matters, it might be well for me to ask, What is ventilation, and why is it necessary? Ventilation is the act of replacing foul, impure air, in a confined space, with pure air. Please note that word "replacing." Times without number have I had people assure me that they had looked out for the ventilation of their house, as they had fire places in all the principal rooms. When asked if they did not know that "Nature abhorred a vacuum," and that their fire places would not exhaust unless there was some means provided for replacing the air thus removed, would reply, "They had not thought about that, but guessed there would be enough leaks in the doors and windows, anyway." I could cite any number of leading authorities and read whole chapters showing the necessities of ventilation and the vast consequences of the result of continued breathing of impure air, but a mere statement of the component elements of air will suffice for this article. If we divide air into 10,000 parts, its composition would be as follows: Oxygen, 2096; nitrogen, 7900 and carbonic acid 4 parts. When the proportion of carbonic acid in a room is increased from the normal amount of 4 parts in 10,000 to between 6 and 7 in 10,000, a faint, unpleasant odor is usually perceptible to one entering from the fresh air; if the proportion reaches 8 parts the room is said to be close. According to some authorities, a full-grown man at rest will exhale through the pores of the skin and from his lungs nearly ⅘ cubic foot of carbonic acid per hour. Taking a room containing 2500 cubic feet of air in its normal condition, we find that the air contains 1 cubic foot of carbonic acid. Now, let us suppose this room to be a sleeping room, not ventilated, occupied by two persons eight hours each night. If the windows and doors of the room were closed during the eight hours, the natural portion of carbonic acid would be increased to about 13 cubic feet (or 1 part to 200), and the occupants would arise in the morning with depressing headache. A person coming into the room from the outside would declare the air to be "foul," and a man does not need to be a crank on ventilation to reach the conclusion that such a situation would be anything but healthful. This condition could be obviated, to a certain extent, by raising the windows, but that practice is dangerous in results, is a prolific source of colds and sickness, and as a means of ventilation totally unreliable, not to mention the morning's discomfort of arising in a cold room. Accurate ventilation will replace the air in a given room every 20 or 30 minutes without dratt.

FINAL ADVANTAGES.

I wish to call attention here to the reason why the combination heater will from natural causes give more perfect and greater results in ventilation than it is possible to obtain from indirect steam or hot water, more particularly hot water. The force which we use to crowd the fresh air into the room and drive the foul air out is due to the expansion of the fresh air by heat. Air expands one-four-hundred and ninety-first of its bulk for every degree it is heated above 32° F.

Thus it will be seen if we heat the air 50° warmer than the surrounding air we have increased its bulk very nearly one-tenth. The greater the difference in temperature the greater the expansion, and, as a natural consequence, the more rapid the movement of the warmer air. On a moderate winter day the indirect radiator in a hot-water job is rarely heated over 130° to 140° F., and as it is not possible for the air in passing through the stack to absorb more than from one-half to two-thirds of its heat, the temperature of the air flowing into the room under such conditions will rarely exceed 75° to 80° F. As the force with which the air comes into the room depends upon the difference in temperature of the air in the stack and the air in the room, it will be readily seen that the movement must be very sluggish. With the combination heater, the air coming in contact with the fire and smoke surfaces only, the temperature is raised much higher, with the result of a rapid flow of a large volume of air into the room in question.

Now, one more point, then I am through. In installing a combination job great care should be taken to place the heater as near the center of the work as possible, locating all air registers as near the heater as practical, so as to insure short connecting pipes in the basement. Always locate registers away from windows or cold walls, selecting, if possible, the warmest side of the

room. Cold and warm air are always antagonistic, and you should give the warm air all the advantage possible if you wish for the best results.

Lastly, the combination system of air and water heating particularly is in the market to stay, and to you who are interested in residence or school heating the subject is worthy of your most careful consideration.

Mr. Thompson of Philadelphia asked whether any experiments had been made in sterilizing air by subjecting it to a very high temperature, for the prevention of disease, to which Mr. Hoffman replied that he was not aware that anything had been done in that direction. The association then went into executive session.

The executive session was devoted to a discussion of the report of the Committeee on Constitution and By-laws. Some changes were made, one of the most important being the formation of an Advisory Council of past presidents for a term of five years hereafter, the past presidents now in existence to serve so much of five years as yet remains from the time they finished their terms as presidents. Thus John Davis of Chicago, the first president of the association, would serve for one year; Charles J. Gillis of New York, for two years; Samuel I. Pope of Chicago, three years; Albert B Franklin of Boston, four years, and P. S. Hudson of Chicago, five years. The Advisory Council is not to supersede the Executive Committee in any way, but is only to be called together whenever the president may deem it advisable for the settlement of important questions.

WEDNESDAY AFTERNOON.

The labors of the convention were resumed in executive session at 3 o'clock. Shortly afterward the doors were thrown open. On motion of Mr. Kenrick of Boston, a resolution was adopted that it is the sense of this convention that the use of standard flanges should be put in force on January 1, 1894, and that no other flanges should be specified after that time. Discussion of the report of the committee on permanent headquarters was the next thing in order. They had reported in favor of continuing the existing arrangement of establishing headquarters in the city in which the president resides. After an expression of opinion on the part of several members the report was adopted and the committee continued for another year. A paper by H. W. Heath of Lynn, Mass., was then read on "Amount of Heat Lost after Passing through Boilers and Utilization of Products of Combustion," which we hope to print in an early issue.

Albert B. Franklin of Boston then read a paper on "The Paul Air-Removing System," which will likewise be printed later.

The reading of these papers was attentively listened to by the members, but no discussion was evolved. An adjournment was then taken to Thursday morning.

THURSDAY MORNING.

(By Telegraph.)

Thursday morning session began with the announcement of the receipt of $200 from St. Paul to be added to the funds in the treasurer's hands. Mr. Kenrick stated that an error had been made in the *Daily Bulletin's* copy of the treasurer's report. Massachusetts was credited with but $680, but it should have been $1340.

R. T. Crane of Chicago then read a paper on the early history of the manufacture of wrought-iron pipe. He stated that the demand for wrought-iron pipe began with the invention of illuminating gas in the latter part of the last century. The first gas pipes used were gun barrels, as at that time no other method was known for the manufacture of wrought-iron pipe. The invention of butt welding was first introduced at Wednesbury, England, in 1825 by James Russell. The Whitehouse method, brought out afterward, was described in detail, as it is the one which is still in use. Steam engineering then began to be recognized, with the building of railroads, and with the more extensive use of steam engines lap welding became necessary for greater strength. About 1830 to 1835 Russell experimented in this line, spending large sums of money. Martin Jones then took it up, using four welding rolls, while Russell used only two. The Jones method was successful, and lap-welded tubes were then made in a commercial way. The development of the industry in America was briefly touched upon merely to show its magnitude to-day.

Messrs. Simmons, Franklin and Thompson were appointed a committee to draft resolutions of thanks to manufacturers and jobbers for the entertainment provided for members.

Election of officers was then taken up.

Enoch Rutzler was unanimously elected president.

Harry D. Crane of Cincinnati was elected first vice-president.

Edward P. Bates of Syracuse second vice-president.

A. C. Walworth of Boston third vice-president, without opposition.

E. D. Smith of New York was unanimously elected treasurer.

John B. Hughes of St. Louis was elected sergeant-at arms.

The president then appointed Messrs. Franklin, Smith, Hughes, Crane and Prentice a Committee on Nominations for Executive Committee, who, after a brief recess, reported the following list:

J. L. Wells, James Curran, Andrew Mercer, Geo. H. Morris, J. D. Clarke, all of New York, who were unanimously elected.

It was then decided to meet next year in New York. The printing of a souvenir volume of proceedings of this convention was left to the old Executive Committee. The Committee on Resolutions of Thanks to Manufacturers and Jobbers for entertaining the convention then reported very complimentary resolutions, which were unanimously adopted. Announcement was made that the paper entitled "A Successful Heating Plant" would be read by S. I. Pope of Chicago at the banquet in the evening at the World's Fair.

Installation of officers was next in order, and President Hudson introduced the new president in a very complimentary speech, which was replied to by Mr. Rutzler. Other officers were then formally installed. P. S. Hudson of Chicago moved a resolution of thanks to Secretary Reynolds for his services to the association during the past five years and recommending to the new Executive Committee that they re-employ him if they see their way clear. A standing vote was taken on this motion, and it was carried with no opposition. The compliment was acknowledged by the secretary in a speech counseling harmony and the cultivation of good feeling among the members.

Mr. Franklin of Boston then magnificently eulogized Chicago, and ended with proposing a vote of thanks to the Chicago members for the manner in which they had entertained the visiting delegates. On motion of Mr. Kenrick, a vote of thanks was also extended to the retiring officers. Mr. Geiger of Buffalo moved a vote of thanks to the press for the interest taken in the work of the association and for what they had done to promote the welfare of the organization.

The convention then adjourned to meet next year in New York.

SIDE ISSUES.

— THERE was less of a display of goods than has been the rule at previous conventions, due to a reaction from the splendid display made at Boston last year, and the fact that a few blocks away the sample rooms of many of the manufacturers gave a complete line of goods for inspection.

— ONE HOT-WATER MAN illustrated the cause and effect of successful hot-water heating by stating that if you had a spring of hot water at the top of a hill that was running 50 gallons out of it down a ditch, and you wanted 2 gallons of it 70 feet over to the right and 10 gallons over to the left, you would simply take a shovel and dig ditches of the right size to get the desired quantity there, and the same common sense must be used in hot-water heating.

— THE D. F. MORGAN BOILER COMPANY, Akron, Ohio, had one of their new hot-water boilers on exhibition painted and gilded to make a parlor ornament instead of a cellar necessity. Rapid vertical passage of water through the boiler and long indirect passage of the products of combustion over the water chambers, so that the smoke pipe is cooler than the flow pipe, is the special claim for this boiler. Their claim for the steam goods is equally strong. Colored pictures of the World's Fair buildings were presented in an envelope with the compliments of the company by E. J. Yunker, manager of the Chicago House.

— THE SIMPLEX SYSTEM of mains for hot-water heating, invented by Curt J. Balthasar of St. Louis, was exhibited by J. W. Fryer of 1906 Cora Place, St. Louis, Mo. It consists of a cast-iron pipe with a diaphragm in the center to divide the flow and return, and has openings in the top and side for the flow and return branches Its use saves the return pipe and the use of ties, and received the favorable comment of the visitors. During the past winter it has been thoroughly tested in St. Louis with, we understand, excellent results.

— H. S. VAN VOLKENBURGH kept in rapid circulation the literature of the Mount Heater Company of Detroit, Mich., and having just returned from a trip from the West had plenty of facts at hand to show that this hot-water heater furnished all the heat units desired when the cold units came in avalanches and cyclones on the outside. In mild weather, early fall and late spring the thin vertical water, ways enable prompt heating with a wood fire. Another feature of this boiler is the ease of draining it.

— S. W. ENTRIKEN, representing the Entriken-Elder Electric Company of Harrisburg, Pa., the general Eastern agents of the Electric Thermostat Company of Minneapolis, exhibited the automatic electric heat regulator. It was shown by a model in connection with a valve on a street steam supply and a steam heater, and was also shown connected with a Sun boiler. It is adapted for controlling the fire to produce a stationary temperature at the degree at which it is set. A fall in temperature of 2° will start the thermostat, which opens or closes the circuit, causing the motor to open or close the drafts. The motor is operated by a spring, which is provided with a crank for winding it up when it runs down. An ordinary open circuit battery of two cells is all that is required to release the spring. Their experience is that it works equally well with any sort of a heating apparatus, and is so sensitive to temperature that the breath will release the motor.

— C. YINGLING displayed the Equator steam and the Gulf Stream for hot water for the Nason Mfg. Company of New York. Polished brass models of both set on a table covered with red cloth surrounded by the literature of the company. Conspicuous among this was their bevel edge black card with gold and silver bronze letters "10 to 1 we sell the Equator for steam and the Gulf Stream for hot water and guarantee that these boilers will evaporate 10 pounds of water at 212° to steam at 212° with each pound of coal burned in them."

— THE HOLLAND RADIATOR & MFG. COMPANY of Chicago made an attractive display of radiators, 20, 26, 32, 38 and 45 inches in hight, exposing a heating surface of 2, 2⅝, 3⅜, 4 and 5 square feet to the loop respectively. They were finished in different colors and gold bronze.

— JOHN MILLAR, winner of one of *The Metal Worker* heating prizes, represented the Boynton Furnace Company, New York and Chicago. The goods shown were a No. 18 Niagara water heater, a No. 23 and 37 Boynton's water heater for hard coal, and a No. 208 specially constructed for soft coal. The walls were decorated with a collection of photographs of some handsome residences and buildings which were heated by their goods.

— PRESIDENT GEO. P. STEEL of the George P. Steel Iron Company of Camden, N. J., manufacturers of steam and hot-water heating apparatus, renewed his friendship with the trade at the Revere House.

— AS CHAIRMAN of the Entertainment Committee, E. J. Yunker kept the boys out of hot water and showed them a general good time.

— PRESIDENT JOSEPH BOND of the American Radiator Company was ably assisted in dispensing the best wishes of the company by Manager J. A. Goodrich of the New York office and Chas. K. Foster, Wm. Hill and Samuel Hopper of the home office. Their office and wareroom at 111 and 113 Lake street, Chicago, being so near, they made no display at the Revere House. The exhibit of radiators made in their showrooms is, perhaps, the most elaborate and varied to be seen anywhere in this country. It is almost a department of the World's Fair in itself.

— GEORGE BOLTON of the George Bolton Boiler Company of Detroit showed a model of the new improved G. & J. R. Bolton boiler made by the Foskett & Bishop Company, New Haven, Conn., and the Nashville Machine Company, Nashville, Tenn. Mr. Bolton was assisted in explaining the boiler to the visitors by John C. Doyle of Nashville. Circulars containing interesting information on the construction which they employ are freely distributed. Mr. Bolton was well known by the members and kept jokes in free circulation.

— THE RAYMOND & CAMPBELL MFG. CO., Middletown, Pa., have on exhibition three of the Lindemuth Sun heaters for steam and hot water. The Sun heater No. 2 for hot water is shown with galvanized iron casings. The Sun heater No. 2 for steam has the castings painted white with gold stripes, while the casing is of planished iron with polished brass bands. The Sun sectional heater No. 2, of which a sample is also on exhibition, is mounted in a manner similar to the steam heater.

— SMITH & WINCHESTER of Boston, Mass., exhibited the Volunteer boiler, made by the W. H. Page Boiler Company, Norwich, Conn., both for steam and hot water, in charge of N. E. Frost, who dispensed the literature. The boilers are made in ten sizes and both the ash pit and the fire pot section are cast in one piece, while the upper water sections are shipped all screwed together, so that only two joints are to be made when setting them up. A sensitive draft regulator in connection with the boiler is operated by the expansion of the water and not by the temperature of the room.

— G. W. DUNN presented a very acceptable souvenir from the Western Valve Company of Chicago, in the shape of a small directory of the city and the fair, with a map. With this almost any point of interest in the city can be found.

— J. D. STILES, the representative of Jenkins Bros., is a real orator whether talking valves or other matters and always holds his audience whether engineers or social acquaintances.

— AMONG the most popular representatives were the ladies that were in attendance, about 40 in number.

— HOSEA WEBSTER, the manager of the Chicago house of Henry R. Worthington of New York, distributed a souvenir that had very little to say about pumps, but was a large and very acceptable map of the city and the World's Fair Grounds.

— W. S. PHILLIPS of Phillips, Doup & Co. of Brooklyn, N. Y., manufacturers of steam and hot-water heating apparatus, is making quite a study of the fair, and spends odd moments in writing friends at home that Chicago and the fair can be seen at a reasonable cost, and that his impression before starting of exorbitant charges has been demonstrated all wrong.

— WHEN he has time from the many demands made upon him, as the official stenographer of the association, P. G. Munroe, of the *Master Steam Fitter*, can relate a story with telling effect and is generally rated good goods.

— IN THE ABSENCE of the popular Doc Morgan, John B. Hughes was pressed into service as sergeant-at-arms, but after a good dinner it was next to impossible for him to get a quorum promptly into the meeting hall.

— THE POPULARITY of P. S. Hudson is not hard to understand. He is one of the most genial of men, never too deeply immersed in business to forget the dictates of politeness. A most striking example of this trait was shown while he was delivering his presidential address at the opening of the convention. The members were listening with the deepest attention to his incisive sentences when an acquaintance entered on tiptoe, and noiselessly took his seat. But the eagle eye of the president saw him nevertheless, and with an aside "How are you, Harry?" went on again with his address, unconscious of having done anything unusual.

— J. POEHNER of Poehner & Dillman of Joliet, Ill., who carry on a general business in tinning, plumbing, gas fitting, hot air and steam heating, says they can never be separated and that the tinner will always be able to buy all the steam and hot-water goods he requires.

— E. N. SQUIRES, secretary and manager of the New York Central Iron Works Company, Geneva, N. Y., was a popular guest at the Revere House, and left as a souvenir a russia leather match safe bearing the inscription in gilt letters: "None can match the Dunning boiler for steam or hot-water heating"

— E. D. SMITH, from the New York house of Baker, Smith & Co., was a guest of the Chicago house and enjoyed the convention thoroughly, taking part in many discussions of heating and ventilation.

— JOHN A. FISH, managing director of the Gurney Hot Water Heater Company of Boston, was by no means a fish out of water, but right in his element, having a good time and doing the fair incidentally.

— H. B. SMITH & CO., Westfield, Mass, were represented by A. C. Mercer of the New York house, who left the Mills and Mercer boilers for steam and hot water out of the question, and was busy shaking hands and chatting with his many acquaintances.

— T. C. JOY & CO. of Titusville, Pa., were represented by C. W. Wright and S. S. Brewer of the Chicago house and D. Coldstock of Titusville. They made no display, but spread joy through the Revere House by an invitation to inspect their line, the pioneers of flue radiators, at 96 Lake street.

— SAMPLES of the Littlefield patent steam trap were shown by Foss & Noble, general agents. The object of this trap is to discharge condensation into tanks or into the atmosphere. There are no flanged connections or bolted joints in this trap, all necessary packing can be done without taking the trap apart and it is without any interior mechanism.

— THE AMERICAN BOILER COMPANY were well represented by George E. Downe, manager; C. V. Kellogg, treasurer, and traveling salesmen as follows: T. F. Gerrells of Denver, J. A. Farrell of Iowa, M. L. Foote of St. Louis and Robert Munro of Pittsburgh. The company made no exhibit at the Revere House, preferring to invite members of the convention to visit their elegant headquarters, not far distant, at 34 and 36 Dearborn street. The American Boiler Company have made no exhibit at the World's Fair, on account of lack of space to properly show their extensive line of boilers. Four of their Spence hot-water boilers are, however, in use whenever required in the propagating houses in connection with the horicultural department, and another was put in the Chinese theater.

ON TUESDAY C. H. Simmons of the Theodore Jacobs Company announced that he had been authorized by Mayor Harrison of Chicago and President Higginbotham of the World's Fair directory to invite the members of the convention, the ladies accompanying them and the manufacturers and jobbers to attend the performance of "America" at the Auditorium on Wednesday evening. Forty boxes were placed at their service. The courtesy was accepted with hearty thanks. It was afterward ascertained that the modesty of the Chicago members caused them thus to conceal the fact that they were responsible for this entertainment and not any outside interests.

— E. J. YUNKER of the D. F. Morgan Boiler Company, in behalf of the manufacturers and jobbers of the United States, extended an invitation to the delegates and their ladies to visit the World's Fair on Thursday afternoon. A sufficient number of tally-ho coaches was engaged to take the entire party to the fair by way of the magnificent boulevards on the south side of the

city, and on arrival at the grounds a fine lunch was provided in one of the restaurants.

— MINGLING among the members, meeting with a hearty welcome everywhere, was George Standart, secretary, treasurer and manager of the Exhaust Steam Purifying Company, Chicago and New York. The headquarters of this company are at 736 Monadnock Block, Chicago.

— THE W. C. VOSBURGH MFG. COMPANY, makers of gas fixtures and electroliers, were represented by Theo. W. Starbuck for the East, R. A. Sugden for the South and Nate L. Maher for the West. The company's headquarters in Chicago are at 184 and 186 Wabash avenue, where they have a very fine salesroom.

— THE UNITED STATES HEATER COMPANY of Detroit, Mich., were represented by their vice-president, A. T. Henderson, a man of genial presence and wide acquaintance among the members of the convention.

— THE THANKS of *The Metal Worker* are due to P. G. Munroe, the official reporter of the association, for courtesies received at his hands.

— THE MODEL HEATING COMPANY of Philadelphia, New York and Chicago were represented at the convention by John J. Spear and George S. Gregory of Chicago, who discoursed on the merits of the Novelty hot-water circulator.

— MARK E. MONASH, vice-president of the Van Auken Steam Specialty Company of Chicago, made every man glad to meet him, and could by pressure by induced to say a word about Van Auken's duplex automatic air valve.

— THE NASHVILLE MACHINERY COMPANY were represented by Manager John C. Doyle, who thoroughly enjoyed meeting so many good fellows in his line and entirely forgot the machine shop, brass foundry and line of steam fitters' supplies he left at home.

— JAMES P. MARSH of James P. Marsh & Co., Chicago, had a pleasant greeting for each visitor at the convention, and the question of valves never came up except as a stop to the interview, when his card showed the improved automatic air valve.

— A TALL MAN, A. J. Sweeting, Auburn, N. Y., carrying what resembled a gun case, attracted no little attention, but he was found to be most docile and genial, and his weapon Hill's adjustable chain pipe wrench. The lever or handle of the wrench screwed up against the jaw, so that the trouble of getting a chain wrench to take hold is avoided. Mr. Sweeting is the general agent for the Roll Paper Cutter Company of Richford, N. Y. One of his orders for this wrench was from a Western house for 100.

— LOUIS BENDIT, representing Scott Valve Company, Chicago, was an acceptable visitor to every group at the convention.

— G. M. DAVIS & CO., Chicago, exhibited in parlor B several of their steam heating and regulating specialties. A Davis noiseless back-pressure valve was shown with the side cut out, giving a clear idea of its working.

— THE A. A. GRIFFING IRON COMPANY, Jersey City, N. J., were represented by treasurer S. D. Tompkins and Leonard Elliott and F. W. Somers of the Chicago house. In their headquarters, parlor 100, they exhibited something new in radiators, the Colombia, for both steam and hot water, which was investigated with interest by the fitters.

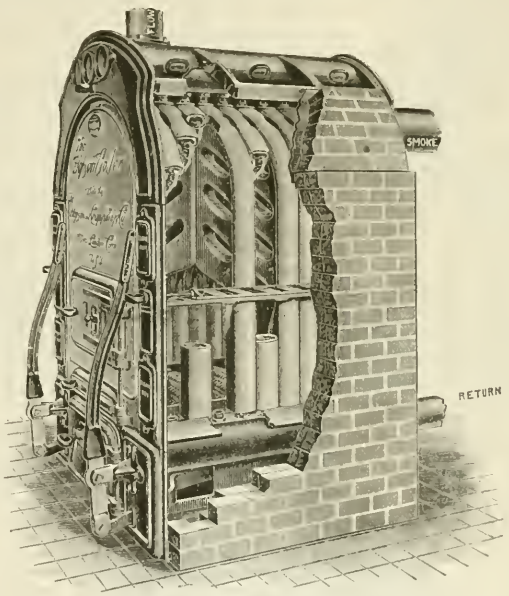
— JOS. MACWILLIAMS of Jos. MacWilliams & Co, Louisville, Ky., who stands high with the members as a good fellow, reported a growing interest in heating by steam and hot water in his section.

— BEAUTY, brilliancy and *bon comaradie* were represented at the convention by R. D. Reed of H. B. Smith Company, J. D. Stiles of Jenkins Bros. and Clarence Woolley of the American Radiator Company.

— IF ANY feel slighted by missing their names from this list it is due to the mist on our glasses when we looked their way.

The Hopson Boiler.

The cut presented herewith shows a broken view revealing the interior construction of a Hopson boiler, an apparatus designed for warming houses by hot water, and made by the Hopson & Chapin Mfg. Company, New London, Conn. The general features of the boiler are clearly shown in the engraving. It consists of upright sections comprising side waterways, and inclined intermediate waterways connecting with a vertical passage in the middle. At the top nipple connections are made



Broken View of Hopson Boiler, Showing Interior Construction.

with a water dome of elliptical section, while the bottom of the water legs are similarly connected to headers on either side of the boiler. The whole is incased in brick, or made portable if so desired, and at the top are hand plates which may be removed so that the interior surface can be thoroughly cleaned. In addition to the removable plates at the top, clean out plates are provided at the front and rear, so that every part of the boiler is accessible and likewise in plain sight. The course of the hot gases is controlled by means of damper plates at each side of the sections between them and the casing, as shown in the picture. The hight of the boiler is 6 feet, the width of the portable style being 47 inches and of the brick-set style 60 inches. They are made in nine sizes, with from 8 to 16 sections; 135 to 280 total square feet of heating surface, and 4 to 9⅛ square feet of grate surface, adapted to an average radiation supplied of from 1100 to 2600 square feet.

GEO. H. TAY COMPANY of San Francisco are considering the advisability of locating a branch establishment in Portland, Ore. The company give attention to steam, hot-water and hot-air heating throughout the entire coast country, and also do a large business in plumbers' and tinners' supplies. They have put many large heating plants in buildings in the Pacific Northwest during the past year, and at the present time are figuring on large contracts in that territory. They have heretofore been represented in Portland by B. F. Rittenhouse, Jr.

How We Selected a Boiler.

BY SWIPED JOINT.

My wife and I thought we ought to have our new suburban residence warmed by steam or hot water. Our neighbor, Mr. Stay-at-home, advised us to let the job to MOTTS, our town PLUMMER, who, he said, needed all the work the place could give him to sustain his yacht. My wife, who was very anxious to secure the very best boiler made, suggested inserting a brief notice in *The Metal Worker* and Westfield GEYSER, asking for circulars and prices.

Thinking this a CAPITOL idea, and one likely to secure a good deal of information about MODERN heating apparatus, it was promptly acted upon. Business took me out of town for two or three days. After my return I went to the post office, where I found a brief note from the postmaster requesting me to call at his private office. Going there in considerable wonderment, he called my attention to a large pile of mail matter, and informed me that being unable to place it in my box he had instructed the clerks to deposit it on the floor of his office, and requested me to have it removed. Requesting him in turn not to put on such MAJESTIC airs, I politely directed his attention to the addresses, reminding him that the office was a free delivery one, and I would hereafter have my mail delivered at my residence. A colored *attaché* of the post office took that mail away in a wheelbarrow. When I reached home

my wife handed me a letter from our architect, DUNNING me for a promised advance payment on the plans and specifications of our new house. She said the rest of the mail would keep until after supper. Soon after supper she accompanied me to the library, where the accumulations of three days lay piled in heaps on the floor.

Christopher COLUMBIA ! That gun was loaded. There were circulars and pamphlets, illustrated and otherwise, of every boiler and circulator on this GLOBE and under the SUN. Every PAGE filled with ROYAL descriptions and testimonials of their UNIQUE construction and PERFECT circulation ; each and every one of them entirely FAULTLESS and worth their weight in GOLD, and all O K beyond a doubt. We postponed more particular examination until the next evening. While at breakfast the next morning the mail carrier came BOLTON in with another grist, and the NOVELTY of selecting an IDEAL heating boiler was becoming real interesting. Our daughter, LILY, foreseeing how we should be engaged, sought permission to accompany a newly landed French gentleman, LE BOSQUET, to the WINDSOR hop that evening. I was about to GRANT her request when our oldest son, GORTON, said : "If sis goes you MOUAT let me go, too." His mother VOLUNTEER-ed to remind him that two were company but three was a crowd.

I came home early that afternoon expressly to select our boiler, and found the collection of *circulating* literature had been very materially increased during the day. My wife told me that the mail carrier had intimated possible trouble if we were using the U. S. mail to further some fraudulent scheme. I replied that I did not care a CONTINENTAL for what he said, but if this was to go on increasing we would have to find a larger house or leave town. This remark of mine occasioned my wife some little anxiety, and she very *fitting*-ly remarked : "WETHER-BED we better go, MERCER ?" However, after supper, and when baby had gone to sleep, we both went at it, determined to settle the *heated* question before we went to sleep. My wife insisted that we should practice ECONOMY. This thing was going to cost "like sixty." She had been looking over the circulars during the afternoon with Mrs. BOYNTON, whose house was heated by hot air, which didn't cost one-third as much as hot water. Mrs. B. told her that, during last winter, by putting on double sashes, storm doors and weather strips, their house was part of the time so warm the plants withered and the wall paper cracked. Everything shrunk, including the children's cheeks. There were occasional puffs of gas and smoke, "but you know," Mrs. B. said, "you can't help that."

"SCOLLAY, my dear (I call my wife Scollay for short), you know we are not building a hot house, only a dwelling to live in and we want it well warmed and ventilated. We don't want to get withered too soon. It makes wrinkles." That was a SPLENDID hit, for you know women hate wrinkles. If you want your wife to put on the airs of a *Eulalia* just intimate to her that you see a wrinkle coming in the corner of her eye. So, she says, "ALL RIGHT," and into it we went. After that the way my wife went through that pile of *heating material* would make a salamander laugh. Judging it prudent to slow her down a bit I very sweetly remarked, "MA HONY, see here la the STOVER and the SOLIEL ; they are about PERFECTION; examine them." Evidently she misunderstood and replied: "Stover builds windmills, but we don't want a solid wheel," and off she ran again before I could check her. She reminded me of a summer whirlwind playing antics in a meadow. I could catch glympses of renowned names, SMITH, MACKAY, GURNEY, BUNDY, O'KELSEY, as the circulars landed here and there about me. I began wishing that we lived away down in FLORIDA or somewhere about the EQUATOR where heating apparatus are not needed.

Seeing that matters were rapidly approaching a CLIMAX, and unable to bear the su-SPENCE any longer, I clasped her in my arms, exclaiming, "STAR of my hopes ! SUN-RAY of my heart ! Radiate your attention toward your offspring." With a cry of pain she tore herself away, and dashing pamphlets to the winds, bounded from the room and grasping the half-waking infant, exclaimed, "Run for Doctor PLAXTON, quick ! Baby has got the DIRIGO. Been eating green KEARNS (currants) again."

When peace and tranquillity had once more assumed their sway we retired. But the curtain of night failed to shut out those heating MILLS. Visions of *valves*, *regulators* and *registers* came trooping through my brain. When sleep had about put a *damper* on them, I was gently borne away on a steamship to shiver among polar icebergs. Then, shifting course, we cross the GULF STREAM, and sail amid palm-laden islands, the fragrance of TROPIC bloom burdening every breeze. Changing to a rumbling railroad train, the lick-a-ty-click of the wheels calling faintly, "direct-indirect," "direct-indirect." Again, slowing down, as though approaching a station, it calls: "Vent-i-late," "Vent-i-late," "Late," "*Too-late*," as a GIANT form rears itself above me. Now the scene changes to a merry-go round, where the hobby riders assume the forms of boilers and radiators, carrying gaudy banners inscribed: "America for AMERICAN s," "On to RICHMOND," "To the VICTOR belong the spoils," "The UNION forever."

Round and round they fly. Faster and faster grows the merry race. They mingle and pass in such rapid succession. Royalty and plebeian melt into one chaotic mass. With the accompanying music of the organ, voices are heard calling "What's the matter with FURMAN ?" "A million dollars reward for the arrest of WILKS !" Now, as the very earth trembles with the tumult, there rises a cry of alarm. "*Where are we at now ?*" While amid a whirring noise that rivals the roar of a thunder storm the response comes: "*Hurrah for the hot-water convention !*" as the merry-go-round and its boisterous crew vanished from sight as though a CYCLONE had swept it away.

Again the scene shifter interposes and rank on rank of cavalrymen and infantry come marching to solemn music, followed by carriages and civilians bearing wreaths and garland of roses and jasmine. With well regulated step and floating banners the procession threads its way toward a cemetery where 10,000 grass-grown graves and marble slabs mark the last resting places—not of patriots and heroes, nor of those who wore the blue or the gray—but of the unnumbered victims of hot-air furnaces. As we approach we behold incribed on the arch gateway: "Sacred to the memory of those who died from hot air."

A sharp, glad cry, EUREKA, at my side dispels the sad vision, and my wife tells me the vexing question is solved, for she has found a NEW CIRCULATOR that not only warms the house from cellar to attic, but has surplus power to heat the conservatory and run a greenhouse. It will regulate itself, shake down the ashes, put on fresh coal, wind the clock, lock the front door, turn off the gas and call the servant girl in the morning. Evidently, she too, has been dreaming, and the problem contains many HITCHINGS yet. How shall we end this too realistic dream ? And ending it end all. Truly, I never would have monkeyed with this thing had I supposed it was loaded. And to make my sorrow all the harder to bear my wife says "I told you so." Mr. Editor, stop my paper and notify the trade that we are not going to build a house, and have bought a boiler and gone to Chicago.

HEATING NOTES.

THE WORLD'S FAIR STEAMSHIP COMPANY'S steamer, "Christopher Columbus," claimed to be the largest excursion boat in the world, is heated with radiators manufactured by the American Radiator Company, 111–113 Lake street, Chicago.

A PRICE-LIST of wrought iron, brass pipe and boiler tubes, brass and iron valves, &c., is issued by the Exeter Machine Works, 32 Oliver street, Boston, Mass. The pamphlet of 16 pages contains a list of prices, tables of sizes, illustrations of the more important goods and several cuts of some of their specialties, including the Exeter radiators, Exeter sectional steam boiler, &c. Separate sheets carry half-tone engravings, beautifully printed, of various Exeter radiators, including the plain for steam or hot water, direct steam, dining room, direct water and semi-ornamental for steam and hot water.

SEALED PROPOSALS will be received at the office of the Supervising Architect, Washington, D. C., until June 27, for all the labor and materials and fixing in place complete of heating and ventilating apparatus for the following named public buildings: Ashland, Wis.; Atchison, Kan.; Beatrice, Neb.; Danville, Ill.; Fremont, Neb.; Lansing, Mich; Lafayette, Ind., and San José, Cal., in accordance with drawings and specifications, copies of which may be had at the office of the Supervising Architect, or the office of the superintendent at each of the buildings.

THE RAYMOND & CAMPBELL MFG. COMPANY, from their New York office, send out notices to the trade that George Evans is no longer acting as their agent, and that correspondence should be addressed to the Raymond & Campbell Mfg. Company, 244 Water street, New York City. They add that Alexander B. Johnston is in charge of the business at the above address, as manager, and has an attractive line of goods to offer the trade.

JENKINS BROS., 71 John street, New York, have recently perfected a rubber compound valve seat, in the form of a hard rubber disk, which successfully holds against high-pressure steam. They feel it has passed the experimental stage. The disks now sent out are an advance on those heretofore made during the past year. They have also increased the thickness of their iron body valves, so that hereafter they manufacture only one grade for high or low steam pressure.

THE RETAIL STORE.

The Miller Lamp.

Edward Miller & Co., 10-12 College place, New York, are putting the lamp on the market shown in Fig. 1. From Fig. 2 it will be seen that there are three wick carriers represented by the

Fig. 1.—The Miller Lamp.

letter K. It is remarked that the wick is fastened to the carrier, requiring no bands, so that it may be raised or lowered evenly, producing a round and even flame. The combination screw and lift movement for raising and lowering the wick is described as being so arranged that with the screw movement the wick can be raised or lowered as little or much as desired, or it can be raised or lowered the full extent of the rod with the hand by one movement. Another feature of the lamp is the cone, which, it is stated, is so adjusted that all sweating of the oil is carried back into the lamp, avoiding leaks. The indicator is a metallic one, hinged so that when filling the lamp it is brought into sight by being raised by the oil, indicating that enough oil has been poured into the lamp. The manufacturers claim that every part of the burner is detachable, so in case of breakage any part can be replaced at a small cost. The lamp is made in two sizes: Nos. 2 and 3. The wicks and chimneys to fit these lamps correspond in size to those used for the Rochester lamp, No. 2 being the same as No. 2 Rochester, and No. 3 the same as No. 10 Rochester.

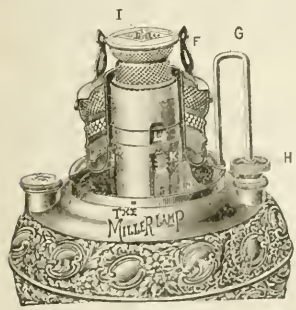


Fig. 2.—Construction of Burner.

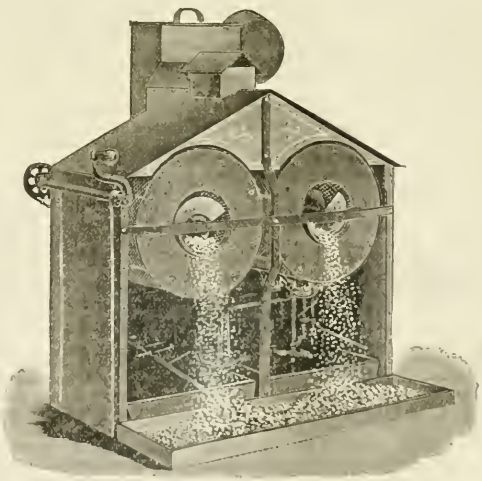
Twin Cylinder Corn Popper.

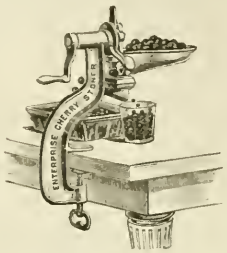
Donathen Novelty Mfg. Company, 510 Broadway, Kansas City, are putting this popper on the market as shown herewith. The fire or heat is furnished by five single burners to each cylinder, formed into a cluster. It is explained that the burners under each cylinder are opened and closed by a single lever, moving about 4 inches, enabling the operator to regulate or to shut off the heat instantly. The cylinders are described as being operated by a double gear, turning the outside shell holding the unpopped corn slowly over the fire, while two pick ups, of coarse wire cloth, separate and carry the popped corn rapidly to the conveyer trough, to overcome all danger of choking up. It is stated that the conveyers discharging the popped corn run at twice the speed that the shell does, thus preventing all danger of the corn catching fire. The machine is provided with a self-feed, described as being under perfect control, to hold the shelled corn. A tube extends through the feed, which is designed to draw surplus heat from the cylinders through the body of corn, to warm it thoroughly before it is thrown into the cylinder. The heating of corn before it goes into the cylinder is referred to as reducing the time required in popping one half. The manufacturers claim that the machine is fed regularly while in motion, thus wasting no time in feeding; that one man operates two cylinders with ease, and that the machine pops corn without stops until the work is all done. The machines are made with a capacity of from 4 to 47 barrels per ten hours.



Twin Cylinder Corn Popper.

Enterprise Cherry Stoner No. 12.

The Enterprise Mfg. Company, Philadelphia, Pa., are introducing the above



Enterprise Cherry Stoner No. 12.

article, illustrated herewith. It consists of a clamping frame, with a platform and feed hopper. On the upper end of the clamping frame is an extended eye, through which passes a spindle operated by a crank handle. The end of the spindle fits into a slot or groove in the head of a four-bladed vertical knife adjusted to a groove immediately in front of the hopper. The operation of the machine is described as follows: By turning the handle the cherries pass from the hopper, the knife takes out the stones, which fall into a vessel, and the knife returns; a sweeper attachment to the spindle follows the plunger and carries the fruit into a receptacle. The manufacturers claim that the machine will stone cherries with the least possible cutting or disfigurement. The stoners are supplied tinned only.

WORLD'S FAIR NOTES.

Pennsylvania's Mining Exhibit.

Pennsylvania's pavilion in the Mining Building is just in front of the north entrance east of the main aisle. Stepping into the pavilion the visitor passes between neatly finished glass cases containing 300 bottles filled with petroleum and petroleum products. In front of these cases stands a huge relief map of the State, 7 x 14 feet, showing the location of all coal and iron mines, oil and gas fields, blast furnaces, pipe lines and railroads. The most attractive feature in the exhibit is a complete working model of a coal mine and breaker. The model occupies a space 24 x 8 feet. Nine engines are shown with the work they do from the time the coal is hauled up the inclines, dumped into screens, where it is assorted into sizes and loaded into railroad cars, while the mine cars return by gravity for fresh loads.

Beside the model stands a little pavilion constructed to show the possibilities of slate. Every use to which slate can be put—for roofing, school slates, and so on—is shown. At the west side stand 16 truncated pyramids, disposed in rectangular form, showing all the varieties of anthracite found in the anthracite region and also all the commercial sizes. Analyses of the different varieties are exhibited. At the corners of the rectangle are glass cases 2 feet square and 8 feet high displaying the varieties of bituminous coal. A colored drawing is shown, illustrating the manufacture of zinc oxide and spiegeleisen. Another case contains samples of the 30 varieties of fire clay found in the State, crude and burnt, and the bricks made from it.

Next to it are cases showing the varieties of tile clays, crude, floated, ground, unburnt, burnt, glazed and unglazed. There are also samples of the 78 varieties of building stone in the State, finished and unfinished, shown at the north end of the pavilion. Then there are samples of the glass sands of the State, the different mixtures used for the various kinds of glass and specimens of the finished product. Soapstone, nickel, manganese, iron ore and various stages in the manufacture of iron with charcoal, anthracite and bituminous coal are to be seen.

Near the model of the mine and breaker stands a primitive furnace, such as was used in the beginning of the iron industry. Grouped about it are the various tools used in mining. Upon the south and east walls are photographs, charts and maps of geological and mineralogical surveys, relief maps and the like. In the center of the Mines Building not far distant stands what the Pennsylvanians call an anthracite "needle." It is a shaft of anthracite showing a vertical section through a 54-foot vein in Schuykill County, with the coal, slate seams, &c., in their proper place.

A California Midwinter Fair.

Californians in attendance at the World's Fair have conceived the idea of holding a fair on the Pacific Coast next winter as a sequel to the Chicago fair. Having secured the necessary financial backing by correspondence with their home institutions, they have gone so far as to specifically announce that an exposition will be given in Golden Gate Park, in San Francisco, which, opening on December 25 of this year, will be continued during a period of 25 weeks following. In the 25 vacant acres in Golden Gate Park four great buildings will be erected, and to these all the principal foreign exhibitors now having space in the World's Fair buildings at Jackson Park will be asked to exhibit their wares before Californians and visitors from the East and West.

From National Commissioner M. H. De Young of California came the original plan of the projected midwinter commercial World's Fair. The vast extent of the exhibits now at Jackson Park made the plan of putting them into smaller space seem scarcely feasible. But the business interests represented by the exhibitors and the small cost of transportation of those exhibits to California after the close of the World's Fair here made the matter appear in a more practical light. Then came in the consideration of California's glorious climate, a climate where autumnal sunshine fades into the quickening glow of springtime without a day of snow or an hour of winter. Many exhibitors who had gone to enormous expense in making their short-time display at Jackson Park hailed with delight a chance to visit the great West, to them almost commercially unknown, and be afforded a chance to show their wares and perhaps enter into commercial relations with States that they only knew from the pictures in illustrated geographies. During these little informal chats Commissioner De Young chanced to lay his plans before R. Cornely of the German commission and formerly director-general of the Bremen Exposition. Mr. Cornely hailed the plan as a great and glorious one. He immediately enlisted, and within a score of days following he had secured the verbal promise of over 2000 exhibitors in the German, Italian, Swiss, French and Austrian sections to send the best they had in the showcase to California's Commercial World's Fair immediately after the gates at Jackson Park shall close.

The Award System Modified.

John Boyd Thacher, chairman of the Committee on Awards, has, it seems, at last yielded to the pressure brought to bear upon him by foreign and American exhibitors and modified his interpretation of the rules governing the awards. On Tuesday of last week he addressed a letter to the foreign commissioners in which he intimated, it is said, that more than one examiner might be appointed in case a desire to that effect were expressed by the commissioners. The communication was addressed to Camille Krantz, the French Commissioner General, who laid it before a meeting of foreign commissioners the same day. The letter was regarded as being conciliatory, but was not sufficiently clear to satisfy the members, and accordingly Mr. Thacher's assistant, ex-Governor Hoyt, attended the session to elucidate the meaning of his chief's letter. After much questioning Mr. Hoyt made the statement that two or more examiners could be named to pass upon an individual exhibit instead of a single expert judge. This interpretation of the letter was regarded generally as being satisfactory, but to be certain of their ground the commissioners wanted a written statement from Mr. Thacher. They also complied with a previously expressed wish of his that a committee be appointed to meet him and listen to his propositions. There were 30 commissioners in attendance, and from their number they appointed a committee of five, as follows: James Dredge of Great Britain, Adolf Wermuth of Germany, Anton von Palitschek-Palmforst of Austria, J. J. Grinlinton of Ceylon, and Manuel Lemus of Guatemala.

On Wednesday Mr. Thacher himself went before the Special Committee of Foreign Commissioners and told its members they could have juries to pass upon their exhibits. He made this statement so clear that there was no misunderstanding his meaning. This was, of course, very gratifying to the commissioners. But Mr. Thacher did not entirely yield another point for which they have contended, and that is that the Departmental Committee shall have the exhibit written up by the person or persons whom they should designate. At this time, however, it developed that somebody had acted without authority in withdrawing the British exhibits from competition for awards. The secretary of the British commission advised the Foreign Affairs Department that the withdrawal was not approved by the commission.

On Thursday Vice-Chairman King of the Executive Committee on Awards issued to Arthur Leffler, the secretary of the Foreign Commissioners' Association, an authoritative statement of the attitude of the Bureau of Awards, in which it is denied that a one-judge system is to be adhered to. Nothing could be plainer or more conciliatory than the language in which this communication was couched, and it helped strongly to clear up all points of difference. On Friday the foreign commissioners met and addressed a letter to Director-General Davis saying that they would consent to Mr. Thacher's compromise if he gave assurances that it would be carried out. The foreign delegates seemed to fear that Mr. Thacher would go back to the one-judge plan after they had restored their exhibits to competition. The commissioners still insist that the juries shall apportion the work among themselves instead of receiving instructions from Mr. Thacher. While they object to that feature of the plan it is probable that the representatives from Sweden, Norway, Japan, Italy, and perhaps several other nations, will come in for competition rather than have any further discussion with Mr. Thacher. They have secured the jury system, and if that is the only concession they can get, they will accept it under protest. Thus, what might have proved a very disagreeable episode in an international fair has very probably been so well settled that it will no longer vex officials and exhibitors.

The Sunday Question.

Affairs are getting entangled now with regard to Sunday opening. Every department of the fair was thrown open on the last Sunday in May. The machinery was not in operation, but in every other respect the display was the same as through the week, although here and there exhibits were covered by owners who were not in favor of Sunday opening. The day was pleasant and the attendance was large, but not up to the extravagant figures that had been widely estimated by the enthusiastic advocates of an open Sunday. The attendance on Decoration Day, two days afterward, far surpassed it.

Litigation on this question is now proceeding. On Monday of last week the exposition directors were temporarily enjoined from closing the fair on Sunday by Judge Stein of one of the State courts, in the suit of Charles W. Clingman against the World's Columbian Exposition to enjoin them from Sunday closing. The questions at issue were gone over in the opinion, which is

quite a lengthy one, but which rests mainly on the ground that Jackson Park was given to the people for public uses only and that no power existed to debar them from using it on any day of the week. The logic of the decision seems to be in favor of the free admission of the public also, but that point was not pressed. The preliminary injunction expires on the 8th inst. and is then expected to be made perpetual by the Sunday openers. On the following Wednesday, however, Judges Wood, Jenkins and Grosscup, sitting as the United States Circuit Court for the Northern District of Illinois, took up the hearing of the chancery suit of the United States vs. the World's Columbian Exposition Company, to enforce the Sunday-closing clause adopted by Congress. The whole question of the rights of the parties, the condition of the contracts, and the powers of the company to make and enforce a Sunday opening rule was discussed by counsel, the hearing occupying several days. Another suit to enforce Sunday closing has also been brought by Wanamaker & Brown of Philadelphia and P. W. Pratt of Massachusetts, stockholders in the Exposition Company, who claim that their stock will be injured by the adoption of the measures necessary to satisfy the Government in case the exposition is regularly opened on Sunday.

The Sewage Cleansing Works.

From no odor would the large white building in the southeast corner of the grounds be discovered as the sewage cleansing works. It is marked IK on the maps, and is well worth a visit by all interested in sanitary matters. The system of sewers and the works were placed by W. S. MacHarg, one of Chicago's engineers, who is engineer of the water supply, sewerage and fire protection of the exposition. Conveniently located to the different buildings are 26 large pits into which the sewage from the adjacent buildings runs. Connecting these pits with the branch sewers are 52 ejectors, which work automatically by compressed air, emptying the contents of the pit through the branches into the main sewer running to the cleansing works. Compressed air for all purposes on the grounds is secured from a central plant for compressing it in Machinery Hall. On reaching the works the air pressure raises the fluid about 50 feet through a 36-inch pipe, where it overflows on a wire sieve which catches sticks and other insoluble matter. Passing through the sieve it falls to the bottom and through pipes it enters four purifying tanks, each of a capacity of 250,000 gallons. In the pipes which carry it to these tanks a solution of alum is thoroughly mixed with it by mechanical means, and at another point a solution of lime is mixed in the same way. In three of the tanks alum and lime are used, but in the fourth copperas and lime give apparently the same results. Slowly passing through these tanks the sludge settles at the bottom, and the clarified water made chemically pure passes off to Lake Michigan. By a careful system of measuring this outgoing water an increase in attendance at the fair is detected very quickly. The sludge which collects at the bottom of the tanks is pumped off and forced through the filter by compressed air, the accumulation being pressed into cakes at a pressure of 110 pounds. These cakes are taken to a garbage furnace and burned, a jet of crude petroleum forced in with a blast of compressed air being the only fuel used. The works are under the charge of Allen Hazen, a chemist from the experimental station of the Massachusetts State Board of Health at Lawrence, Mass., who has been detailed for this important work out of courtesy from the Bay State to the World's Fair, through the influence of Engineer MacHarg. The attendance at present sends about 1,000,000 gallons of sewage to the works every day, and the capacity is 6,000,000 gallons. The increased attendance on Decoration Day sent 299,000 gallons extra sewage to the works. At the present rate of attendance about 4150 tons of sewage are handled daily and the solid matter after being pressed weighs but 3 tons. The crude oil, used for various purposes about the grounds, is brought from Lima, Ohio, by a pipe line. For burning the sludge from the works and the garbarge made inside of the gates about 500 gallons of crude oil are consumed daily.

In addition to cleansing this sewage, Mr. Hazen is compiling some other statistical information in reference to the work. The principal visitors to call on Mr. Hazen have been sanitary engineers, and doubtless with the Mecca of the United States being located at Chicago this year, his interesting charge and the genial courtesy of both himself and his assistant will bring him many other visitors.

We recently saw at the New York office of Henry R. Worthington a set of 13 pictures, showing exterior and interior views of the Worthington Hydraulic Works at Brooklyn and Elizabethport. These pictures are bromide enlargements, 30 x 40 inches, from original plates 11 x 14 inches, made by Geo. P. Hall & Son of New York, and are to be used in connection with the Worthington exhibit at the fair. The subjects were so selected as to convey a good idea of the magnitude of the works, and to give a clear conception of the detail arrangement of the several departments. From a photographic point of view the pictures are exceptionally fine.

OBITUARY.

JOSHUA HENDRICKS.

Joshua Hendricks of the metal firm of Hendricks Brothers, 49 Cliff street, died suddenly in New York City Saturday evening, at his home, 512 Fifth avenue. Mr. Hendricks belonged to one of the oldest and most prominent Hebrew families in New York. He was 61 years of age. The business house of Hendricks Brothers, which is one of the largest of its kind in this country, was established in 1764 and has been in the family through four generations. Mr. Hendricks was widely known. He had been a member of the Chamber of Commerce for many years, and at one time he was vice-president of the German-American Bank. He also belonged to the American Geographical Society. A widow and three sons survive him.

A process of enameling sheet-metal work has been patented by Victor Dubois and William C. Stewart of Harvey, Ill. The special feature of the process relates to the means of producing a mottled effect. The first coating of enamel is applied in the ordinary way, and to the porous unglazed enamel coating a suitable volatile liquid is applied in spots or mottles, after which the article is placed in an oven and dried, so that the volatile liquid will be evaporated. When this has been done and the article placed in the furnace the spots or mottles are developed, producing the desired variegated appearance.

Granite City.

At the invitation of F. G. & W. F. Niedringhaus, about 100 gentlemen, representing the commercial interests of St. Louis, visited Granite City, Ill., the new city established by the Niedringhaus Bros., on Saturday, the 27th ult. The occasion of the visit was the opening of the new Union Depot and the breaking of ground for the new factories of the St. Louis Stamping Co. A special train was provided which conveyed the party to the ground, where they were shown over the city by F. G. Niedringhaus, after which they were invited to partake of a collation tendered. Addresses were made by leading citizens of St. Louis, who wished the new city every prosperity, and one and all took occasion to congratulate F. G. Niedringhaus, president of the St. Louis Stamping Company, upon the change which had been wrought in a place which a few months since contained nothing but trees and underbrush, but which to-day is a beautifully laid out tract. The city will contain the works of the St. Louis Stamping Company, comprising an open-hearth steel furnace, a rolling mill and stamping works, which will employ between 1200 and 1500 people. In addition to this plant will be the machine shops of the St. Louis, Chicago & St. Paul Railroad, the Goltra Steel Company, whose plant will occupy 5 acres, with a daily output of from 75 to 100 tons of steel, and a car spring and car coupler works will also be built. Granite City will contain an extensive and modern gas works, electric light works, a large and modern hotel, public schools and many residences, a number of which are already finished. Granite City is located in Illinois on the east side of the Mississippi River, about 2 miles from the city of St. Louis. Nineteen railroads give access to the East, assuring cheap freight, rapid transit and no bridge charges. The city is also surrounded with a belt line, which connects it with every railroad centering in St. Louis, 27 in number, thus giving it all the railroad advantages enjoyed by St. Louis itself. There are also 3 miles of river front, securing access to river navigation and at the same time river rates on freight. A free public library will be built.

The coal fields adjoining this city supplied 4,000,000 tons of coal during the year 1892. We are informed that a saving of from $8 to $10 per car is made on coal delivered in Granite City. When this is taken into consideration, and the railroad facilities are borne in mind, it is easily understood why the St. Louis Stamping Company and others have decided to move their plants to this point.

There are a number of manufacturing concerns who are at present negotiating for ground on which to erect their plants, but the negotiations have not as yet reached a point where their names can be published.

It is reported that at the McShane Bell Foundry, Baltimore, Md., drawings are being prepared for what will be the largest bell on the American continent. It will weigh 44,000 pounds—1000 pounds for each State in the Union.

PLUMBING and GAS FITTING.

Texas Master Plumbers.

The annual meeting of the Association of Master Plumbers of the State of Texas was held in the city of Fort Worth, May 22 and 23, 1893. The convention was called to order by J. A. Rogers, president of the local association, who introduced Mayor B. B. Paddock in a pleasant little speech such as plumbers are especially happy in. Mayor Paddock welcomed the delegates in behalf of the city of Fort Worth, and what he said was received with much applause. Gen. F. M. Clark, secretary of the Board of Trade, and who is also an orator of well-deserved reputation, was next introduced and delivered an address full of pleasing hits and good humor. The meeting was then called to order by President Berla of El Paso and proceeded to business by appointing a Committee on Credentials, after which an adjournment was taken until 2 p.m.

The afternoon session was given up principally to a consideration of the report of the Committee on Credentials until 4 o'clock, when a carriage ride was taken to view the water works plant, the suburban part of the city and the brewery. At the latter place the affable president, Martin Casey, turned things loose, and every plumber, it is needless to say, enjoyed himself. Each delegate was presented with a handsome Russia leather purse as a souvenir of the visit, for which the thanks of the association were duly returned. If there is one thing above another a Texas plumber prizes, it is a purse (well filled).

After supper a short session was held and at 10 p.m. the entire party partook themselves to the Arlington Inn on the Heights to partake of a bounteous repast, which was enjoyed thoroughly by all. Remarks were made by General Clark, who acted as toastmaster, Mayor Paddock, Hon. D. F. Sullivan, Editor Senter of the *Gazette*, President Berla, General Frank A. Campbell and others, which made life worth living. There was still some doubt, we understand, whether it was frogs' legs or chickens that the plumbers feasted on.

Tuesday morning's session was devoted to routine business. The election of officers and delegates to the National Convention was next in order. The following officers were elected to serve the ensuing year:

President, D. J. May, Galveston.
Vice-president, Edward Braden, Jr., San Antonio.
Secretary, George Mummert, Dallas.
Treasurer, A. H. Shafer, San Antonio.
Sergeant-at-Arms, J. T. Rogers.

EXECUTIVE COMMITTEE.

D. F. Sullivan.
F. A. Campbell.
G. D. Aekley.

The following delegates were elected to the National Convention:

D. F. Sullivan, Dallas.
A. Berla, El Paso.
J. F. Osbourne, Fort Worth.
A. H. Shafer, San Antonio.
D. F. May, Galveston.
D. Cavanaugh, Dallas.

A vote of thanks was extended to the Mayor, Superintendent of the Water Works, secretary of the Board of Trade, brewery management, the press and the local association, for hospitality and courtesy shown. The convention then adjourned.

Water Service in Tenements.

From R. M. J., *Baltimore, Md.*—Can you help me with an opinion as to the best way of arranging service pipes in a building where each floor is occupied by a family and by which the inconvenience of one tenant having to wait until some other tenant has ceased to draw off water in order to get the needed supply from his own faucet may be avoided? The water is supplied from street pressure, and I am supposed to be able to arrange the pipes so that while the occupant of the lower floor would be drawing off water the top-floor tenant could do the same. I have been told that if I carry my main supply pipe straight through to the top floor without taking off branches for the several floors, then make a return bend and carry the pipe downward, taking from the down pipe the branches necessary to supply each floor, I will be able to accomplish the desired purpose. As this double piping is rather expensive as an experiment I would wish to be certain of my ground before I would undertake to solve the problem in this manner? Is there any reason why this plan should not work satisfactorily? Have you anything better to suggest?

Answer.—The plan proposed by our correspondent is not a desirable one as far as results to be obtained are concerned. 1, There is the cost of the double or return line of pipe, made necessary by the fact that no supply branches are to be taken off the riser. 2, Because the pressure from street mains in cities is unequal at different hours of the day and consequently is unreliable as a steady means of supply where the water has always to rise a sufficient hight to be carried over the bend and down the return pipe. There should be sufficient head in the main at all times to give any promise of satisfaction by this plan, as a little consideration will show. Let us suppose a lessening of the head or pressure by which the water would not be forced over the bend, how was the supply to be furnished to the several floors. The only dependence in that case would be on the syphon principle by which the cocks or faucets below the level of the head might be supplied, but as the syphon is easily broken, for instance by the opening of a cock above the level of the water in the rising service pipe, the chances are that the supply of water for the entire house during the continuance of the low pressure will be cut off until the pressure in the main is again sufficient to bring the water over the bend.

Other plans have been devised for accomplishing the results aimed at—viz., enabling occupants of different floors in a building to draw water at the same time from a rising pipe supplied by street pressure, but they have been failures for the most part. One, however, which is advocated by one of New York's most experienced plumbers, is to increase the size of the pipe on the upper floors while the supply branches are of the ordinary size. He contends that this is the only safe and satisfactory plan where there is no tank. A larger column of water is maintained in the rising pipe than can be drawn off by the branches on the several floors, and this supply being kept in continued volume there is little fear of interruption in the supply unless under some combination of circumstances which at times cannot be wholly provided for. The master plumber who advocates this latter plan assures us that it is the most satisfactory of the various methods of solving this vexed problem of tenement house water service.

TRAPS AND VENTS.

THOS. HUGHES of the sanitary supply house of Hughes & Keith, Denver, Col., has been in Chicago superintending the plumbing work being put in the Colorado Building at the World's Fair. The above firm have also secured the contract for plumbing work in the capital at Denver, which is to be one of the finest buildings in the country.

HIGGINS & WEAVER, a plumbing firm of Springfield, Ohio, are well spoken of in a late issue of the *Springfield Republic-Times*. They are said to be adepts in their craft, and also in gas and steam fitting; much of the work in the large public buildings and business blocks of the city having been carried out by them.

A CATALOGUE embellished with colored and gilt front cover is issued by the Instantaneous Water Heater Company of Chicago. The scene on the outside of the pamphlet to which we allude is a pretty mixture of the nineteenth century and mythological times, but the chief feature, it is needless to intimate, is the indirect reference to the heaters made by this firm. The

first part of the catalogue is given up to full descriptions and illustrations of the Douglas and the Acme instantaneous water heaters for baths and domestic purposes. Various styles of each of the heaters are shown. Other fittings and specialties are noted in the catalogue, the latter pages of which are given up to testimonial letters.

SEALED PROPOSALS will be received at the office of the Supervising Architect, Washington, D. C., until June 20, for labor and materials for the plumbing and contingent work for the United States court house and post office at Abingdon, Va. Drawings and specifications may be had at the office of the Supervising Architect, at Washington, or from the superintendent at Abingdon.

KIRTLEY BROTHERS, 1213 Walnut street, Kansas City, Mo., have issued a little circular relating to a new and simple system of supplying water by means of compressed air to dwellings, hotels, schools, court houses, and in fact all buildings in city or country. The circular states that the water is lifted by the makers' double action force pump from a well, cistern, spring or lake and forced into a thoroughly tight underground steel tank, made in stock sizes from 6 to 100 barrels capacity. The tank has two openings, and as the water is forced through the check valves, filling the openings, all escape of the air is cut off, and the continued pumping simply compresses the air until no more pumping can be done. The air may be compressed in this way until the tank will be more than two-thirds full of water, when the pressure of air upon the water forces it through the pipes supplying the house or yard fixtures until the tank is emptied. The system is referred to as being very simple and thoroughly practical, and those who have used it speak in high terms of its merits.

THE CINCINNATI DELEGATES to the National Association of Master Plumbers, to be held at Milwaukee, will arrive in Chicago Sunday morning, June 11, at 9 o'clock, via the Monon route.

THE STATE VICE-PRESIDENT OF ILLINOIS, Wm. T. Geary, has issued a call to the master plumbers of the State to convene at 10 a.m., Monday, June 12, in the rooms of the Chicago Master Plumbers' Association, for the purpose of forming a State association. A large attendance is expected.

THE GILBERT & BARKER MFG. COMPANY, 90 John street, New York, are distributing a little book entitled "Home Comfort," as applied to improved methods of cooking, laundering, heating of water and the etceteras incidental to good housekeeping, through the medium of gas as a fuel, in connection with ranges and water boilers adapted to its use. Stress is laid on the facilities for obtaining heat quickly without the annoyance of handling wood, coal and ashes, as well as the ease with which it may be increased, decreased or discontinued, especially during the warm months. The objections from out of town residents are met by offering the Springfield gas machine, which, it is claimed, will economically supply necessary fuel.

Tin ore found near Kenova, W. Va., which has been assayed in Cincinnati, is reported to be of very rich character.

Japan coal can be delivered in San Francisco at $7.50 per ton, including freight and duty, and an American firm is said to have contracted for a large quantity, beginning with 100,000 tons per annum.

Prize Competitions

$25.00.

Prize Competition No. 27.

SUBJECT:

Local Associations of Merchants.

It has been found feasible to form associations in many places for the purpose of securing more friendly relations among competitors and reaching an understanding in regard to matters of common interest. Among the good results referred to as coming from such associations are the following: Overcoming petty jealousies; cultivating a spirit of fraternity; listing of undesirable customers; an understanding in regard to time of presenting bills; putting in operation early-closing movements; agreement as to the prices at which goods are to be sold; mutual accommodation in supplying goods which one merchant may be temporarily short of, &c. The subject is thus evidently a broad one and of a good deal of practical interest. In discussing it the following points are suggested:

Whether it is desirable to have such associations:

How such associations may be organized;

The objects to be accomplished by them.

It will also be of interest to have any information in regard to the practical working of such associations.

This competition will remain open until July 8, 1893.

Those intending to compete are reminded that it will not be necessary to write long essays, but that comparatively brief and business-like answers will be favorably regarded as meeting the purpose for which these competitions are announced.

The following prizes will be awarded:

First prize	$12.50
Second prize	7.50
Third prize	5.00

The prizes will be awarded for answers which, in the judgment of the Committee of Award, are most suitable for publication and of the most general interest.

We reserve the privilege of extending the time on any competition in case the contributions received are not of sufficient number or merit for the committee to award prizes. These competitions are open to every one, and it is hoped that there will be a general response from business men. We shall have the privilege of publishing any or all of the contributions received.

Replies are to be received not later than July 8, 1893. They should be addressed as follows:

DAVID WILLIAMS,
96-102 Reade street,
New York.
Prize Competition No. 27.

The committee to whom the contributions in Prize Competition No. 13 were referred have awarded the prizes as follows:

First Prize to E. D. WARNER, Jackson, Mich.

Second Prize to G. H. BURNETT, St. John, N. B.

Third Prize to JAMES D. RICHARDS, Covington, Ky.

Other Competitions which have closed are now in the hands of the Committees of Award, who are giving careful attention to the claims of the different contributions. From the number of these and the evident merit of not a few of them, we are assured that a great deal of valuable information and suggestion will be put at the disposal of the trade.

The Weekly Prize Competitions noted below are now before our readers and remain open until the dates named:

No. 20. (Reopened.) Closing June 10.

A Reliable System for Securing the Correct Charging of All Goods Sold on Credit.

No. 25. Closing June 24.

Show-Window Display.

No. 26. Closing July 1.

To What Extent Are Manufacturers and Jobbers Justified in Selling to Consumers.

No. 27. Closing July 8.

Local Associations of Merchants.

Owing to the depressed state of an overstocked market during the last two or three years, says the United States Commercial Agent at Magdeburg, in a letter published in the June number of consular reports, German manufacturers of enameled sheet iron have formed a trust, with the object of preventing overproduction by regulating the output upon the home market. Incidentally a scale of prices, rebates and other charges have been agreed upon. No attempt is, however, to be made for the present to control the sale of exported wares, even when sold to German buyers. The combine is made up of manufacturers in various parts of the country, some 30 works having been included thus far. The principle upon which the association will operate is to measure future production by the general average of past sales, the exact quantity to be produced by each factory being apportioned by a committee. It is not proposed to effect sales through the central agency, which is in Berlin, but every firm will secure their own orders as heretofore, and are responsible for carrying out their contracts. One firm is permitted to take over the orders of another, but no firms thus uniting may exceed their combined quota. If at the end of the year certain works have failed to produce their allotted quantity they are to be reimbursed for the difference at a fixed rate by those firms overproducing. This is adjusted through the central bureau. Guaranty deposits are required to be made with the central office by each firm, and members bind themselves not to erect new works or interest themselves in firms outside the combine. The trust compact expires December 31, 1895.

Peace is restored in Nicaragua by the success of the revolutionists and trade is resumed.

STOVE TRADE NOTES.

Echoes of the Stove Convention.

—THE STOVE MANUFACTURER who didn't attend the convention because he thought the National Association was about defunct made a mistake. He should have gone at any rate, because sometimes it is a gracious act even to go to a funeral. As it was he would have found a very lively corpse. The general opinion is that the late convention was one of the best ever held.

— IT WILL BE GRATIFYING to many who did not attend the convention, owing to an intention to visit the fair later, to learn that the fair is well worth seeing, and that the convention will go down to history noted for the general harmony of feeling and the deep interest taken in its affairs by all present.

— AS IS NATURAL with an interchange of ideas, the educational gain to members at the convention will be of great benefit. It has made many much stronger in their loyalty to the association.

— "STOVES HAVE SEEN THEIR DAY," was the odd observation of a visitor who said that sales of hot-air furnaces had greatly increased last year and that about 100,000 was the number marketed. From another source came the remark that stoves and steam and hot-water heaters would make the hot-air furnaces rank as an antiquity at the next fair. Interesting prophecies!

— P. W. ELLIOTT AND A. W. WALKER of Boston and W. E. Walker of Taunton, Mass., not only represented their particular companies, but also New England, with an interest and energy that made up for the lack of numbers from that section.

— HENRY WILSON, who travels for the Thomas White Stove Company in Oklahoma and surrounding territory, was earnest in his recapitulation of the many climatic, scenic and agricultural advantages of that section. Arcadia possessed no more attractions for the blacksmith, Basil, the father of Evangeline, in the poetic past, than Oklahoma presents to the settler for a homestead to-day, according to Brother Wilson.

— DE WITT VAN EVERA was welcome in every group in the Palmer House rotunda, for his little reminiscences were the reflections of a gentleman with a lively sense of humor and a keen eye for the bright side of everything and a fund of information.

— WILLIAM WEWERS of the Gem City Stove Mfg. Company, Quincy, was the largest man, physically, in attendance at the convention. Representing a stove foundry which was started nine years since on a very limited scale, his position in the stove trade has gradually risen until he is looked upon as one of the coming leaders. His company have just completed an addition of 60 x 60 feet to their foundry, making room for ten more molders.

— H. W. BENNETT of the Indianapolis Stove Company is one of the cultured men of the stove trade and a brilliant conversationalist.

— MANY FAMILIAR FACES were missed from the Eastern Pennsylvania delegation. Prizer, Seivard and J. Allison Orr came from Reading; Canfield represented Danville; Mott, Pfahler and Stevenson from Philadelphia, and Lansing from Scranton completed the representation. The confidence placed in Pennsylvania is reflected in the selection of Mr. Prizer for first vice-president and the re-election of Mr. Stevenson for treasurer of the National Association, and the re-election of Mr. Mott for treasurer of the Defense Association.

— ONE of the cheeriest talkers met was Geo. W. Willcox of Charleston, Ill., a true philosopher, who envied no man his exceptional prosperity, believed in doing the best under all circumstances, and regarded the field big enough for every one to get a reasonable share of business.

— FRED. WILL of the Sill Stove Works was the picture of good health, and no man received a warmer welcome than he from his trade associates.

— W. H. WHITEHEAD of the Chicago & Erie Stove Company is one of the patriarchs of the trade, although time has not yet whitened his locks. Keenly appreciative of the humorous side of life, he is, nevertheless, predisposed to gravity, and seriously and with dignity carefully analyzes the various problems coming up for solution.

— J. W. EMERY of Quincy, smoothly shaven as usual, presented the youngest appearance of any that have seen so many heats poured off in their time.

— THE MAN who will always be young is Fred. W. Gardner. He seems to have found the long-sought-for elixir of youth, which not only protects him from the footprints of time, but preserves the fascinating and unique personality that makes every acquaintance a friend. Few would suspect his erect form and jaunty air to be burdened with the vast responsibilities which he so easily carries.

— OF THE YOUNGER GENERATION of manufacturers, J. D. Graff left the foundry at Sharon, Pa., to represent Graff & Co. of Pittsburgh, and Lew A. Anshutz of the Anshutz-Bradberry Company also journeyed to Chicago to assist in the deliberations of the convention. Mr. Anshutz is proud of the fact that his foundry up to May 1 had made 100 heats, which means 300 for the year, if there are no untoward interruptions.

— THE FOLLER-WARREN INTERESTS, East and West, were ably represented by G. G. Wolfe of Troy, N. Y., and Fred. Hawkins of Chicago.

— THE MASTERLY PRESENTATION of the manufacturers' side in the wages conference by ex-President Grange Sard was the talk of the convention. As a man of affairs, thoroughly well informed, broad in his views, blessed with an easy flow of language, courteous in his manners and free from all affectation, Mr. Sard has won a high position in the estimation of his fellows. Ratubone, Sard & Co.'s Western branch was duly represented by Wm. H. Sard and Edmond Rattery, to whose ability the great success of this important undertaking by the company is largely owing.

— THE NORTHWESTERN REPRESENTATION was not numerically strong. Neenah, Superior, and other stove works north and west of Milwaukee were unrepresented. Manager Ralph of the defunct Sioux City Stove Works was a looker on, but not a participant in the proceedings. By the way, Mr. Ralph takes a very hopeful view of the future of this plant if experienced stove men secure control of it.

— HENRY CRIBBEN was not obliged to conduct an active electioneering campaign for the presidency of the Defense Association. He would indeed have preferred to step aside if the association had expressed a preference for some other leader. But they regard him as "the right man in the right place," and will probably continue to re-elect him as long as he does not positively refuse to serve.

— IT IS BAD ENOUGH to oppose a man as a candidate for an office and then see him elected by a unanimous vote, but it must be infinitely more galling to find that his salary has also been raised, as a sort of sinister tribute to the effectiveness of the opposition. Such was the result of the attack on Secretary Thomas. Who wouldn't be attacked if this was to be the result? Another campaign of opposition will probably mean another advance of $1000 or $1500 a year.

— AMONG the stovemen at Chicago seen in the Palmer House rotunda, but not members of the convention, were C. W. Smith, vice-president and general manager of the Cincinnati Steel Range & Furnace Company, makers of Burton steel ranges; T. F. Hull, manager H. Rendtorff & Co. of Chicago, and John Rogers of the Home Stove Works, Chicago. Although not members they were very much interested in the proceedings.

— MANAGER HULL of Rendtorff & Co., Chicago, it may now be stated, has just taken a radical step which will cause something of a sensation in the stove trade. He has engaged Mrs. A. F. Strobel, formerly of Keokuk, Iowa, to represent the firm in Nebraska. Her husband is traveling salesman for F. & L. Kahn & Bros. of Hamilton, Ohio, in the same territory. Mrs. Strobel has had experience in managing a retail store, and she is expected to do well in her new line. It is believed that she is the first lady stove salesman (?) on the road. Manager Hull deserves much credit for making the experiment. May she prove an unqualified success!

— C. W. SMITH of the Cincinnati Steel Range & Furnace Company has but recently returned from a trip through the extreme West. Among their recent notable shipments was one to Honolulu of ten Burton steel ranges, which is only the first of a lot that is to follow.

— THE SOUTHERN REPRESENTATIVES at the convention were: W. J. Anderson and R. G. Rennolds of Richmond; Henry Terstegge and W. L. Bridgeford of Louisville; and J. M. Kelly of Lexington, Ky.—all men of substance and high standing.

— CENTRAL ILLINOIS turned out in force. Quincy was well represented by Castle McAfee, and others; Peoria by Hunter; Bloomington by Hamilton; Charleston by Willcox; Joliet by Moore; while across the river, and practically in the Quincy district, came both Duffy and Trowbridge from Hannibal and Hobbs from Keokuk.

— THERE have been conventions at which Ohio was more conspicuous in numbers. But what was lacking in quantity this year was made up in quality. Lazard Kahn of Hamilton read a fine paper on "Consolidation."

— ST. LOUIS takes great interest in the association, and is likely to be more interested than ever with Geo. D. Dana in the president's chair. Holland, Van Cleave, Filley, Hogan and McCulpin are a strong team to back any president, but backing Dana—well, just look out for next year.

— WE HAVE ONLY one fault to find with Brother Dana. He is too modest. He should have permitted his address to be printed in *The Metal Worker*, even if he kept it out of every other paper.

— DETROIT was well represented as usual. The Michigan Stove Company had a full delegation, but the genial countenance of E. S. Barbour was missing from the De-

troit Stove Works. The Peninsular Stove Company showed up strong, and the Art Stove Company had their secretary in attendance.

— STATISTICS of the stove trade are lacking this year. We can't tell our readers how many per cent. 1892 surpassed 1891, or how many per cent. 1893 is going to fall below 1892—simply because the secretary's report was not permitted to be made public.

— NEW YORK turned out well. There was a delegation of 12, who came from every section of the State.

— THE INDIANA STOVE MAKERS took strong interest in the proceedings. The stove trade of that State is growing rapidly.

— J. L. PRESCOTT & Co. of New York, manufacturers of Blackene stove polish, had a lively representative in the person of J. M. Trnesdell of Chicago, who seemed to know everybody. Mr. Trnesdell has established an office at 15 Michigan avenue, Chicago, where he carries stock for filling small orders.

— MANY MEMBERS of the convention had their wives with them, who took great pleasure in visiting the points of interest about Chicago, and, of course, attending the fair. They were specially invited to see the onyx and brass lamps and tables which E. A. Ireland of the Matthews & Willard Mfg. Company had on exhibition.

— THE THANKS of *The Metal Worker* are due to B. W. Dodson of the Detroit Stove Works for invitations to enjoy the luxury of the company's tally-ho for a trip from the heart of Chicago to the World's Fair grounds. Only lack of time could have prevented the acceptance of such an invitation.

— THE DETROIT FOUNDRY EQUIPMENT COMPANY of Chicago and Detroit distributed among the members of the convention an indexed guide map and key to the World's Fair, which was very highly appreciated. A. T. Whiting and S. T. Johnston of this company were on the ground renewing old acquaintances and forming fresh ties of sociability.

— CHARLES E. BRACKETT, well known in connection with the trade press, has established a special credit reporting agency, devoting its entire attention to stove manufacturers and dealers. It will be known as the American Stove Association. Headquarters are in the Manhattan Building, Chicago, and a branch office is located at 150 Canal street, New York.

— ALLEN W. UHNER met J. A. Orr and H. Seward of the Mt. Penn Stove Works of Reading, Pa., at the Palmer House attending the convention, he having just returned from a trip to the Pacific Coast, where the Penn stoves and ranges meet with a welcome that brings substantial orders.

— A NEW DAMPER SLIDE KNOB was shown at the convention by H. C. Matthews of Waterbury, Conn., which held the slide tightly in place and could be fastened securely in an instant with the hands. It was examined by the members with much interest.

— C. H. MATTHEWS of the Ireland & Matthews Mfg. Company of Detroit paid a tribute to the stove molders by presenting each member of the committee that appeared before the State Convention with one of his "Always on Time" bronze gripsacks that formed the case for a clock.

— THE COMMITTEE which went before the Stove Convention from the Molders' Union have a kindly feeling for E. A. Ireland, who is the manager of the branch house at 5 Wabash avenue, Chicago, of the Matthews & Willard Mfg. Company of Waterbury, Conn. He presented each representative with one of his souvenir inkstands.

— GEO. P. STEEL of the Geo. P. Steel Iron Company, Camden, N. J., is in Chicago, doing the fair and talking his line of steam and hot water goods.

— W. MCK. BARBOUR, treasurer of the Boston Furnace Company of Boston, is in Chicago, renewing old friendships, having been formerly connected with the Chicago branch of the Abram Cox Stove Company of Philadelphia.

The American Cook Stove.

BY M. P. LOW.

[There is a certain, sad interest attaching to the following incomplete article, which will draw to it more than ordinary attention. The author, Major Low, was well known to the stove trade and had been a familiar figure in and about New York for many years. At the time of his death, which occurred a little while ago, he was engaged in writing an article on the American cook stove, but only the first chapter found completion. The only change that we have made in it is to omit the pathetic "To be continued," which is a promise that can no longer be fulfilled.—Ed. *The Metal Worker.*]

I wonder why man, being "an animal that cooks its food" and endowed with uncommon vigor of mind and inventive genius, should have left the cook stove so long undiscovered. One would suppose that it would have been among his earliest inventions. But be allowed thousands of years to pass, gratifying his taste for cooked food by many rude contrivances for a roast, or fry, or broil, down to the early part of the nineteenth century before he discovered a cook stove. His neglect, or indifference, or ignorance of fire and its uses for culinary purposes during the time from Adam to Noah may be offered and accepted as a plea during that period, for we have no evidence to the contrary, except Tubal Cain, who is alluded to as an artificer and skilled in all kinds of brass and iron work, which implies the use of fire for mechanical purposes only. His plea of ignorance as to the knowledge of fire and its uses will be strengthened when we consider that Noah was commanded to take food into the ark as it was then eaten, and notwithstanding the explicit details given him for plans and specifications for building the ark, no provision was made for the use of fire in any form, or for any purpose whatever. In fact, as the ark had but one door, one window and no chimney, and was "pitched within and without," fire would have been extremely hazardous. I think it is safe to conclude that man's taste for cooked food was unknown to the antideluvians, but was an acquired task, discovered at Ararat, when Noah selected some of the clean beasts and clean fowls from the ark and roasted them upon a rude altar as an offering to the Lord for his safe delivery from the flood. This is the first evidence we have of fire being used for culinary or cooking purposes. As the sweet smelling odors arose from the roast and floated around they were pronounced "good," and man made a discovery by accident as valuable to his race as those made by the fall of the apple, the boiling of the tea kettle or the combustion of anthracite coal.

Many centuries elapsed between Noah and Moses. Man was allowed the flesh of beasts and birds for food, and had cultivated a taste for it, and enjoyed the luxury of having it cooked. It seems, however, that he made but little if any improvement upon Noah's mode of cooking. He had no fire places, no chimneys, no bake ovens. A few stones piled up as a mound to keep the fires and coals from the damp of the earth, a cross bar, supported on uprights at each end of the mound, or niches cut in the sides of rocks and banks as fire chambers, comprised about all the means for gratifying his taste for cooked food down to the time when Moses was commanded to build the tabernacle. During the interval man had sought out and contrived many useful inventions. But he had not produced a cook stove, and had improved but little upon Noah.

Moses had very precise and detailed plans and specifications given him for building and furnishing the tabernacle in every particular except the altar for burnt offering. He was told that Bezaleel, a man of great ingenuity and skill in metal working, had been spoken to in person and requested to devise and construct a suitable altar of cast brass with trimming and mountings and elaborate with gold, and to furnish a supply of pots and shovels and basins, flesh hooks, fire pans and a kitchen paraphernalia of cooking vessels, which he did, except the cook stove.

Four or five centuries passed from Moses to Solomon—many cities with untold wealth and millions of men were on the earth—but not a cook stove. Neither Solomon with all his glory and wisdom, nor Hiram of Tyre, his contractor to build the temple, with all his knowledge and cunning works in metal could produce a suitable cook stove for it. There had been no improvement or new method in cooking among the millions of people since the days of Noah and Moses, for the altar, and its surrounding of pots and basins, and flesh hooks, &c., which Bezaleel had made for the tabernacle of Moses, had been taken to Solomon's Temple to be used at its dedication feast. "They were found to be too little" to cook for so many thousand people, and Hiram, instead of devising a cook stove of sufficient dimensions, went to work and added another lot of small vessels to those brought from the tabernacle. Thus with bonfires in the open air, and numerous pot hooks and trammels, and cross bars, was the great feast at the dedication of Solomon's Temple cooked and served.

There was a long interval of centuries between Solomon and Columbus. Wonderful discoveries had been made by man. Fire places and chimneys and glass were added to the luxuries of his habitations, and fires to supply them with warmth and comfort. But Columbus brought no cook stove with him to America, nor did he find any here on his arrival. He discovered that although the natives had acquired the taste for cooked food, they were using about the same means for cooking at San Salvador that Noah used at Ararat.

Still another century and a quarter passed and the May Flower arrived at Plymouth Rock bringing some useful kitchen furniture, new to us, such as long-handled fry pans, cast-iron bake pans and clay fire pots for burning charcoal, tripods and braziers, but no cook stove.

During the next century the inventive genius of the American was fully developed and is conspicuous in the printing press, the lightning rod, the sugar mill, the cotton gin, the steamboat and

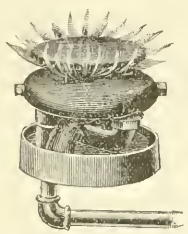
THE AMERICAN COOK STOVE.

THE NORTH DIGHTON CO-OPERATIVE STOVE COMPANY of North Dighton, Mass., advise us that they are now furnishing their Oak Grand, Live Oak and Prize Oak ranges with an oven-door opener. This neat device goes on back of the door and is said to be the only one made that swings the door clear back by a slight touch of the foot.

The P. A. Burner for Coal Oil Gas.

The advantages in cooking and heating enjoyed by those resident in districts where natural gas is available may now, in a measure, be also enjoyed by residents in all sections of the country by reason of an appliance recently introduced for the manufacture and combustion of gas from coal oil. The appliance is shown in Fig. 1 of the accompanying illustrations and is placed upon the market as the P. A. burner. It is very simple and may be adjusted to any stove, range or heater with little trouble.

Fig. 2 shows the burner when in position for use, with the connections necessary for the oil supply. The oil tank A is placed on iron brackets against an outside wall, or any convenient outbuilding, at least 8 feet above the level of the burner, so as to give a pressure to the oil. The tank is made of No. 22 galvanized iron of any desired



Burner for Using Coal Oil Gas.—Fig. 1. —Showing the Burner in Operation.

size and shape. A pipe carried down from the tank through the house wall and under the floor to a point directly in the front of the range or stove supplies the burner with oil. This pipe must be ½ inch as far as the union 7, and from that point to the burner ¼ inch should be used. If the burner is to be used in a heater in a cellar, the supply pipe should be carried along the cellar floor close to the wall so as to be out of the way. The pipe is brought through the floor so that the needle valve 8 will be just outside of stove, and a little to one side, so as to be kept out of the way of doors, and in such a position as to prevent it becoming heated by the fire. A safety overflow pipe, 9, of ½-inch pipe runs from the burner pan to a convenient point distant from the stove where it can be connected to a drain pipe, or where a can or bucket may be utilized to catch any oil which through carelessness may run through the burner. Common brown soap should be used on the threads, and under no circumstances should white or red lead be used for the purpose; a gate valve, 5, controls the supply, and a drain pipe and valve, 2, at bottom of tank drains it. A graduated tin gauge and float, 3, indicates the contents of the tank.

The tank should be filled with 110° coal oil, or standard headlight oil, obtainable of any oil dealer.

Fig. 3 shows a section through the burner. In lighting the spreader 13 is removed, and the cleaner 14 inserted through the central hole until the wire tip 15 enters the gas outlet 11, when the cleaner should be turned once or twice, taken out and the spreader replaced. The valve 2 is then opened and a little oil allowed to run into the lighting pan 6, by way of the gas outlet. The valve is then closed and the oil in the pan ignited. The oil will burn nearly out in from three to four minutes, and in this time will have heated the generator sufficiently to make gas. The valve should then be opened slightly, the gas will form and the operation of lighting is complete. The air feeders are shown at 9 and the generator at 8.

It is claimed that the burner will furnish a steady heat, which will be ready for cooking or baking five minutes after lighting. The fire may be put out in a minute, a very desirable feature in summer, and in winter may be continued during the whole season, the heat at all times being increased or diminished at will by the regulation of the oil supply. The cost of fuel, it is stated, is somewhat less than coal, and the use of the burner obviates the annoyance of putting in and storing coal and the labor and dirt consequent upon taking out ashes and their removal from the premises. The burner is strong and well made, is designed to last as long as a range and is free from smoke. It is placed upon the market by the Pyroleum Appliance Company, of which John Reilly is president, Wm. H. Magoffin treasurer and Dillwyn Wistar secretary and manager. The offices of the company are in the Drexel Building, Philadelphia, and their salesroom is at 242 South Fifth street. At the latter place the burner may be seen in operation in a large-sized cooking stove and its working examined.

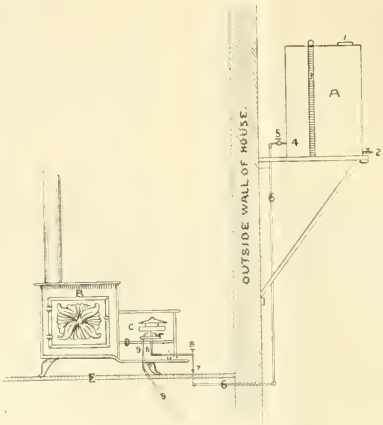


Fig. 2.—Burner Connected with a Stove for Use.

The Western Stove Works

of Peoria, Ill., favor us with a copy of an illustrated catalogue and price-list which they have just issued for the season of 1893, covering leading lines of their manufacture. In offering it to the trade the company state that it has been their aim to keep in the front ranks in the manufacture of stoves and to make improvements where such are desirable in order to meet the demands of the trade. In this they feel they have been successful, and are in a position at present to offer a line of ranges, cook stoves and heaters which "are second to none in the market." The volume, which comprises 34 pages of letterpress, bound in colored paper covers, is profusely illustrated and presents in connection with each stove various dimensions, weights, prices, &c. The leading goods include the

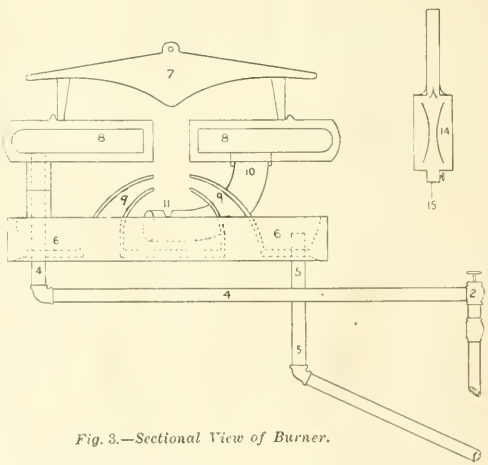

Fig. 3.—Sectional View of Burner.

Lakeview, a six-hole range for soft coal or wood, made in the usual varieties; the Lakeview cook stove, adapted for coal and wood and embodying the modern features; the Silver Lake, a four-hole cook stove for coal or wood, and the Peoria Pride, a four-hole cook stove for wood only. The greater portion of the volume is taken up with cook stoves and ranges, leaving only a comparatively few pages for heaters. The leading place is given to the Pleasant Home, a very neat square base burner for hard and soft coal. This stove has been entirely reconstructed for the season of 1893, and is offered in two sizes. The New Home is a square direct-draft parlor heater for soft coal, having large fire pot, capacious ash pan, cone grate, and other features of obvious utility. The Pearl, a direct-draft heater for soft coal; the Western Cannon, made in four sizes, and the Forest, an all-cast Todd wood stove, are some of the other goods to which attention is invited.

Traveling Salesmen.*

BY C. S. PRIZER.

One of the chief difficulties the stove manufacturer encounters in marketing his productions is the selection of a force of efficient and satisfactory traveling salesmen. The standard of qualifications required of salesmen is steadily advancing. The increasing pressure of competition, the general advance in the intelligence and business capacity among retail dealers, and the necessity of strict business methods enforced by the dwindling profits of these times, make it necessary for manufacturers to employ men of ability and character to represent them to the trade.

These higher requirements have relegated to the shelf many a salesman who was successful under the old *régime*, but who has been unable to make the strenuous effort required in these latter days, or to adjust himself to the changed conditions which now prevail.

It is probable that a larger proportion of those who embark as traveling salesmen fail of success than the proportion of men who fail in any other occupation. This, at least, seems to be the case with those who try to become salesmen in the stove business.

QUALIFICATIONS OF GOOD SALESMEN.

To the making of a good salesman there go tact, judgment, good hard horse sense, a knowledge of human nature, the bargaining instinct and the power and disposition for hard work. The qualifications required to make a successful salesman are distinctly higher than those necessary to insure success in an ordinary retail business. Yet every small retail stove dealer who fails in business seems to hold firmly the opinion that he is peculiarly fitted for the occupation of traveling salesman. Not infrequently he holds out to the manufacturer the tempting bait of a proposition to work out in installments the account which represents the said manufacturer's wrong guess as to his chances of success in the retail business.

Every manufacturer has his idea of what a salesman should be, but I trust that I will not be thought guilty of any discourtesy to that excellent and worthy body of men who are the couriers and missionaries of the stove business, when I say that the manufacturer seldom realizes his ideal among the salesmen in his employ. The difficulty, perhaps, is that those who would make ideal salesmen prefer to labor in other fields, or it may be that in this, as in other departments of business activity, the man who attains unto doing a thing in the best manner does not need to do it himself, but can better find his value in seeing that other men do it.

It would seem that of all businesses none would require of its salesmen a more thorough, technical and practical knowledge of the goods than the stove business. Yet I have known several successful salesmen who knew nothing about stove construction, and to whom even the simple and primary principles governing the operation of stoves were as a sealed book. And I have known several learned, able and eloquent gentlemen, living encyclopedias in the science and literature of stove construction, who were complete, absolute and total failures as salesmen.

MUST HAVE EDUCATION AND CULTURE.

It will be readily granted that every salesman should be a man of education and culture, able to quote Greek and Latin to those of his customers who are graduates of the universities, and to meet them on equal terms in the discussion of the latest scientific and literary questions. Yet, strange to relate, there are many successful salesmen who seem ignorant of the rules that pedants have formulated for the use of their mother tongue, and to whom Herbert Spencer's definition of evolution would be a high-sounding jargon of unmeaning words. It will doubtless be assumed that a good salesman should have a knowledge of that most popular of modern sciences, political economy, which treats of the production and distribution of stoves, as well as of other forms of wealth. Yet there are salesmen who have discovered the secret of selling stoves to the coy and reluctant dealer who do not have a passing acquaintance with Adam Smith, to whom the tariff and currency questions are a weariness, and who know nothing and care less about the factors of production and the laws of distribution. It would be supposed that to insure success the salesman would at least have to be methodical and systematic in his work; and, while method and system are undoubtedly valuable, there are successful salesmen who lack them utterly. I know a successful salesman whose traveling is so devoid of plan or system that he cannot be bribed, coaxed or threatened into furnishing his employer with even the skeleton of a date schedule of a trip. This unpleasant failing is tolerated because of his good work in other directions.

It is often impossible to analyze the qualities that make one salesman successful, or to define the shortcomings that result in the failure of another. The personal characteristics of the saleman are a large part of his equipment, and these he must use after his own fashion. For this reason the knowledge of how to become a good salesman cannot be communicated, be the teacher and the learner ever so willing.

The relations existing between a house and its salesmen should be of the most confidential and intimate character. How can you expect a salesman to appear creditably before the trade as your sole visible representative unless he feels identified with the interests, the policy, the history, the plans and purposes of the house he represents? I believe it is the part of wisdom and prudence for us to furnish our salesmen with as much information as they can absorb concerning the business they are called upon to represent.

Especially should we teach them how to compute the cost of producing and distributing goods. If possible they should be made sharers in the enthusiasm and anxiety for the success of the business which is felt by those whose capital is at stake.

The difficulties and trials of the business should be explained to them, so that they may be the more resourceful in meeting the troubles and frictions that present themselves in their department of work. Every house impresses its character and policy upon its salesmen to a greater degree than upon any of its other employees. Is the house disposed to yield easily to the pressure of competition? Then the salesman soon finds himself unable to secure remunerative prices for his goods. Is the house slovenly and unmethodical in its business? The salesman will inevitably be like it in these respects. Is the house firm and business-like in its policy? The salesman will acquire spinal rigidity and will learn without regret to decline unprofitable business.

UNPROFITABLE PLACES.

The places where goods are sold without profit seem to have a strange fascination for some salesmen. If a salesman of this class finds a dealer who is buying goods somewhere at prices below zero he becomes seized with a mad desire to count that dealer as his own special customer. Why cannot his house sell goods as cheap as any other? What a business this salesman could do if his employer would but allow him a reasonable discretion in prices!

Some salesmen lose their energy and efficiency as soon as they encounter a price which they cannot match. The soul of a salesmen of this sort is filled with terror by the fact that there is some other salesman roaming around with lower prices than he can make, and he cannot do business even where prices are normal and his scalp is safe. I have known salesmen who were completely demoralized by finding two or three places on a route where prices had been cut below them. Some manufacturers and some salesmen seem constantly to be in search of rat holes into which they can pour goods at or below the cost of production. It should be the policy of the salesman to develop and cultivate the trade where prices are remunerative, shunning the sections and the special trade where goods, if sold at all, will yield no margin of profit.

Much of the money spent by the manufacturer for salesmen's salaries and expenses is wasted. I know a small stove dealer located in a cross-roads town in Pennsylvania who keeps a record of every visit paid him by salesmen. This record for 1892 shows that 17 stove manufacturers spent in visiting this one dealer at least 60 per cent. of the total amount of his stove purchases. This, of course, is an extreme case, but I am convinced that manufacturers in many instances spend an amount of money in visiting the small country trade which is out of all proportion to the amount of goods sold.

COST OF DISTRIBUTION.

About one-half of the entire distributing expense consists, for the stove manufacturer of the amount expended for salesmen's salaries and expenses. In these days, when the cost of distribution is steadily increasing, it is remarkable that few, if any, manufacturers are curtailing their outlay for salesmen. On the contrary, it is probable that in this outlay is to be found a considerable part of the increase in the cost of distribution. Under present conditions no manufacturer feels that he can safely curtail this expense. The pressure of competition, growing more strenuous every year, seems, indeed, to render it necessary that he canvass the trade with a thoroughness unknown in former times. The proportion that the cost of maintaining salesmen bears to the selling price of stoves has unquestionably increased progressively during the past 20 years. Is it not possible that this increase in the cost of canvassing for trade might be checked and reversed by some plan of co-operation among manufacturers? Might it not be feasible for a number of manufacturers of one district, producing similar lines of goods, to employ one traveling salesman to represent them in common in country territory where it will scarcely pay each one of them to maintain his own individual salesman?

There are many members of this body who believe that when stove manufacturers are sufficiently civilized they will pool their capital and management, and that they will thereby economize in the costs of production and distribution to such an extent that prices can be materially reduced and profits increased at the same time.

MARKETING GOODS.

Would it not be worth while for manufacturers to take the first step in co-operation by marketing part of the goods they produce by employing salesmen in common to canvass territory which cannot be profitably worked by one house alone? Should an experiment prove successful, the plan could be extended, and it might lead up to that complete co-operation or consolidation, which, to many manufacturers, seems to be the millennium of the stove business.

It has been frequently said that traveling salesmen are employed only because of competitive necessity. That is, it is said, that there is no real reason why personal visits should be made by manufacturers to the buyers of their productions, for if all manufacturers would agree not to send out traveling salesmen, the demand for goods would not be reduced, and the sales of the different manufacturers would bear to each other the same proportion as they do now. If no house had a single salesman upon the road, could not the large saving of expense be divided between the dealer in lower prices, and the manufacturer in higher profits?

While it is true that the present method of marketing goods through traveling salesmen is costly, yet I am inclined to think that under present industrial conditions it is the cheapest plan that could be devised. And it is certainly an error to suppose that manufacturers could realize higher profits by dispensing with able traveling representatives.

* Read at the twenty-second annual convention of the National Association of Stove Manufacturers, held in Chicago May 31 to June 1.

Nothwithstanding the remarkable facilities of exchange and communication that have marked this era, it seems still to be desirable, if not necessary, that those who buy and those who sell should either directly or through representatives meet face to face. In former times, when few salesmen were sent out by manufacturers and wholesalers, the buyer usually visited them at least twice a year to personally make his purchases. As a method of distribution this was wasteful and extravagant, compared with the present plan of employing traveling salesmen. No stove manufacturer spends in salaries and expenses of salesmen as much as it would cost his entire roll of customers to visit his factory once a year.

Any special saving that one manufacturer can make by placing his cost of conducting business below the average may result in higher profits to him if he does not think that it enables him to sell goods at lower prices than those of his competitors. But a general saving which is adopted by all manufacturers cannot permanently increase profits, for the reason that profits in all business, risks and coutingencies considered, tend irresistibly to an equalization. Competition would soon cause a decline in prices that would offset the saving that stove manufacturers could effect by dispensing entirely, by general consent, with traveling salesmen. The largest single item of cost in our business is molding. If the cost of molding could be reduced next week, by the application of machinery or otherwise, to 1-10 cent per pound, profits two years hence would be no greater than they are now. In these meetings of the National Association of Stove manufacturers there is frequently heard the complaint that profits are decreasing, as though this was a condition peculiar to this one business. This, it seems to me, is an error. The economic forces that have reduced profits in this business have reduced them in all others which are not bedged arouud with a monopoly of some sort. Profits cannot be higher than the general average for any length of time in any particular business. For a busiuess that earns more than the average profit will quickly attract capital to such an extent that its earnings will be reduced to the general level.

RATE OF INTEREST.

A reduction in the general rate of interest is always accompanied by falling profits. Interest has slowly but steadily declined in this country during the past 30 years (in Illinois it is said to have fallen one-half during that period), and business profits have decreased correspondingly. To the traveling salesman in the stove business, as well as to his employer, it seems that there is an overproduction of stoves. The business, it seems to them, would be in a much more healthful condition if there were fewer stoves produced ; but this, of course, applies to all stove factories except their own. It is held by many, indeed, that one of the greatest barriers to prosperity is general overproduction in all departments of industry. Now, special overproduction tends speedily to correct itself by reducing profits in the particular line where it occurs, and thus causing the withdrawal from that business of capital and persons, or what is equivalent, by preventing capital and persons from entering it. Special overproduction of certain goods also tends to correct itself by increasing the production of all other goods. For a special overproduction of certain goods enables the people to secure a given quantity of such goods in exchange for a less amount of their commodities or services than would otherwise be required, and they are then able to demand more of the other things that gratify their desires.

LIMITED SUPPLY.

It is, of course, natural for those engaged in a business to desire the supply of the kind of goods they are producing to be limited, but it must be apparent to whoever will think that the largest possible production of all commodities cannot militate against the prosperity of the whole country. Bad times, which mean deprivation and want to large numbers of people, are never caused by overproduction. People never suffer from the lack of clothing, provisions, furniture, shoes, stoves, or any of the other things they desire because there are too many of these things produced.

PRODUCTIVE CAPACITY.

Our productive resources are sufficient in this country to provide enough of all the commodities that gratify human desire, so that every man who is not an idler might have not only the necessities and comforts, but many of the luxuries of life. If many of those who work, or who are willing to work, are unable to secure a good living, it must be because there is some maladjustment in our economic system that prevents our enjoying, as a people, the blessings of comfort and plenty that are easily within our reach.

Indianapolis Stove Co.

We are indebted to the Indianapolis Stove Company of Indianapolis, Ind., for a copy of the catalogue of stoves, heaters and hollow ware which they are distributing to the trade. It is a volume of nearly 70 pages of letterpress, printed in colored ink upon good paper, and bound in attractive covers. In connection with each stove is given such information as the dealer requires in obtaining an idea of the features embodied and the sizes in which the stove is made. The cooks for coal or wood include the Atlantic, the Crown and the Atlas, and those adapted for coal only are made under the name Clifton. The wood cooks embrace the Windsor, the Charm, the Kitchen Queen, the Improved Indianola, the Dexter and the Monon. The ranges are represented by the Tremont, a first-class construction for burning coal, wood and natural gas. The heating stoves occupy the second half of the publication and include many attractive patterns. The oaks are first considered, embracing the Burr, Black, Columbia and Sylva oaks, the latter two being new constructions of attractive appearance. Both are intended for burning wood or coal, the Columbia being made in five sizes, while the Sylva is offered in three. A varied assortment of globe, cannon, cottage parlor and Todd stoves are also included. The company enjoy facilities for turning out first-class work, and the constantly increasing demand for their goods justifies the belief that their stoves are highly satisfactory. In addition to their regular Favorite hollow ware, the company are in a position to furnish a line of extra polished hollow ware when so desired. Illustrations of these goods are found in the closing pages of the catalogue.

The Ideal Traveling Salesman.*

BY FRANKLIN L. SHEPPARD.

Not long since the writer saw in a trade journal the statement, "The only use of a salesman is to sell goods ; and any salesman who does not make this his sole aim must expect very soon to be superseded." It is possible that in a purely mercantile business, one concerned merely with the buying and selling of goods that have no peculiar or distinctive qualities, this may be true. In such a business the goods offered to the customer are exactly similar to goods offered to him by the salesmen of competing houses ; and the decision of the customer as to the house from which he shall purchase, the prices of the goods being assumed to be equal, will be determined by the tact and persuasive powers of the salesman. Other considerations play no part in the transaction.

In the case of a salesman who is offering the products of a stove foundry, however, other elements are present, to which due weight must be given by him, if he is to render to his employer the most effective service. The goods which he is to sell have in some degree, and in many instances in a very large measure, an individual character. They possess certain features which distinguish them from those of competing manufacturers. They bear a distinctive name, under which extensive advertising has in many cases made them known to the general public. They consequently enjoy a certain reputation. This reputation it is the desire of the manufacturer to maintain, and, if possible, to increase. Now, the man who has goods of this sort to sell is working under different conditions from a salesman who is merely offering goods upon which a mercantile profit upon an immediate sale is the only thing sought. The writer of this paper has often felt that in the business of stove manufacture and sale the fact stated is commonly lost sight of, not only by the salesman but even by his employer.

EMPLOYERS TO BLAME.

Employers are often to blame for the shortcomings of the man whom they send out upon the road to represent them. The employer is in most cases strangely unconscious of this. Scarcely a stove convention during the last 20 years has passed at which some one has not deplored the difficulties of the business, and then laid them all at the door of the unhappy traveling salesman. Thus, if prices were too low it was alleged to be due to the foolish salesman, who was ever ready to lend a willing ear to every dealer who would tell him of the far lower prices at which he could buy goods of other manufacturers. If there had been too large an expenditure in patterns, that also was the salesman's fault ; for was he not always insisting that other manufacturers had something better, that patterns must be remodeled to be sold, and that his customers demanded such and such features in the goods, and would not buy until they were added ? If collections were slow and difficult, that, too, was to be charged to the account of the salesman ; for did not his eagerness to sell goods outstrip his prudence, and was he not always bringing an unwarranted pressure upon his employers to sell to men of whose responsibility he was not sufficiently informed ?

No doubt there has been some show of reason in all these complaints, and yet, in the view of the writer, the employer is fully as accountable for their existence as the salesman. It is believed that they arise out of a misconception, on the part of both parties, of the duties of a salesman in a business such as that of stove manufacture. What, then, constitutes the "ideal salesman," and how is he to be educated ?

AIM OF THE SALESMAN.

"The ideal salesman" is not a mere seller of goods. He is the personal representative of the employer in dealing with the customer. The more nearly he can be brought to look at things from his employer's point of view, the more effective service he can render, and the more nearly will he approach the ideal standard. Now, what is the employer's business aim ? Surely not merely the sale by the traveler, upon a given trip, in a given time, of a certain quantity of goods. That is excellent as far as it goes, but the employer's aim is far beyond that. Any manufacturer who has judgment enough to succeed must look far beyond immediate results, and lay hold upon a distant future. He must seek a permanent trade, a steadily growing trade, and a profitable result. To accomplish this three things are necessary:

1. To attach customers permanently to the house.

2. To establish for his wares a good and growing reputation.

3. To obtain prices and terms that shall yield a due margin of profit.

There is, perhaps, more involved in these considerations than appears at first sight. They must be kept constantly in view by the man who aims to reach the standard of the "ideal salesman."

SECURING PERMANENT CUSTOMERS.

First, let us see what is involved in securing the permaneut attachment of customers to the house. In the first instance, tact in approaching the dealer whom it is desired to secure as a customer. His confidence must then be gained. The "ideal salesman," will by his candor and evident sincerity produce the impression that the dealer will find in his house one that will seek the dealer's interests, as well as those of the seller, in their mutual transactions. He will not overpersuade the dealer, if in a buying mood, to purchase more goods of a given kind than the salesman, with all his knowledge of facts, would himself be willing to order if he were in the dealer's place. He will never "double up" an order and send 12 stoves instead of six. He will never scour the immediate neighborhood of a dealer to whom he has sold goods in search of scattering orders from other parties whose trade may

* Paper read before the twenty-second annual convention of the National Association of Stove Manufacturers, in Chicago, May 31-June 1, 1893.

interfere with his. He will give his customer a clear field in which to work. He will see that he is supplied with all the facilities offered by the house in the way of making the goods known. He will show, in every possible way, a friendly and helpful disposition toward the customer.

MAINTAIN THE REPUTATION OF HIS GOODS.

But, in the second place, the "ideal salesman" is careful to maintain the reputation of his wares. To accomplish this he must know them thoroughly—their merits, their defects, and their practical operation. In addition to this, he must also know the merits and defects of competing goods. He must be able to give the dealer as full information as to size, weight and peculiar selling points of his own goods, and he must know the peculiarities of competing goods well enough to hold his ground against all objectors. Herein lies the weakness of most traveling salesmen. They do not know the principles of construction, nor the reasons on which the peculiarities of the goods which they are selling are based. When fault is found they do not know how to meet it. When asked, "Why was your stove made thus and so, and not so-and-so, like Smith & Robinson's stove?" they have no answer ready. They give it up. They go back to their hotel and straightway write to their employers something like this: "No use to try to sell our goods here, Smith & Robinson's goods have the inside track. Get up something next year like Smith & Robinson's stove and we can sell them like hot cakes." Perhaps the employer does so. But next year Smith & Robinson have a stove out which the dealer maintains is still better, and the salesman finds himself just where he was before his employer made the additional investment in patterns.

The "ideal salesman" meets objections at once, and displays an amount of practical information that at first surprises the dealer and then convinces him. He knows that he has goods that are in every way equal in quality and performance to "Smith & Robinson's," and he is competent to prove it. The average salesman always believes that he could sell something that he did not have far more easily than what he was sent out to sell, and this habit of mind is fatal to success. The "ideal salesman" occupies himself with selling what he has, not what some other man has.

SOMETHING THE EMPLOYER SHOULD DO.

It must be remarked that the employer is often to blame for this defect in his salesman. Employers need to take the salesmen more into their confidence, and see that they know the constructive features of their goods as thoroughly, if possible, as the employers themselves. Salesmen should have the opportunity of acquainting themselves freely with the processes of manufacture. They should not be strangers to the foundry, or the mounting room, or the pattern shop. Their interest in all these things should be stimulated and their knowledge increased. They cannot approach the ideal until they know far more, practically, of the goods they are selling, and this they cannot learn unless their employers give them a chance. The "ideal salesman" is kept at the foundry long enough every year to learn all he needs to know. His employer knows better than to suppose that the "salesman's only use is to sell goods," and that he has done all that he needs to for the salesman when he has put a catalogue and price-list in his hands and started him on the road. He knows that under such conditions all that the poor fellow can do is to offer the goods at the lowest price given him, and if he cannot sell them to write home for authority to sell at a price still lower.

FAIR MARGIN OF PROFIT.

This brings the writer to the third point—namely, the necessity of obtaining, in the sale of goods, prices and terms that yield a fair margin of profit. This calls for a combination in the salesman of all the qualities before alluded to—tact, knowledge, persuasive power, candor, sincere regard for the interests of the customer and fidelity to those of his employer. The ethics of trade do not require either that a salesman should get the highest price that he can shrewdly force from a purchaser or that he should offer his goods at the lowest price that his employer, under stress of circumstances, can be induced by his representatives to make. He should never forget that he is the employer's personal representative, and that as such he is bound to act, as nearly as lies in his power, as he believes his employer would act if he himself were present. With such a guiding principle he will not accept unproven and hasty statements from dealers as a basis of prices; he will not disregard the interests of a customer; he will not risk his employer's goods, which are his capital, by placing them in the hands of irresponsible parties or by offering prices in ordinary dealings that were confided to him in his discretion for use in specially important transactions. He will do all in his power to sell on short time, and to effect settlements where he may have the opportunity.

MUTUALITY OF INTEREST.

All this implies a certain degree of intimacy of knowledge of the employer's business policy. The employer, if he wishes to train up men of this sort to sell his goods, must give them such evidence of his confidence and such knowledge of his business policy as shall enable them, when away from home, to judge accurately as to what view the employer would entertain in any given case that they may encounter. This, too, implies a certain permanency of relation. The "ideal salesman" is a long time with one house. He does not change every New Year's day and spend a good portion of each year in scheming to get a place with some other firm. Nor does his employer encourage him to make a change by constant fault finding and censure in respect to trifling matters, nor by paying him a meager compensation. Both parties recognize a mutuality of interest, and each is careful to give the other his just dues.

SUMMARY.

Such is a brief sketch of the "ideal salesman." The "ideal employer" has a good deal to do with his training. He is tactful, well-informed, just, sincere, industrious, careful alike of the interests of dealer and of employer—a man who would scorn to make a misrepresentation of any kind, and who enjoys the respect and confidence of all with whom he comes into contact. He is master of his business and master of himself. He is not often found, alas! If he were numerous, the vexed question, "What is the matter with the stove trade?" would receive the prompt answer: "Nothing whatever!" When he is found, the worst of it is that the "ideal salesman" does not long remain such. He is very apt to be taken into the firm.

ODD PLATES.

WALTER L. CULVER of St. Louis, Mo., is the patentee of a cook stove or range possessing several features of interest. The arrangement of parts is such that the products of combustion pass from the fire chamber over the top of the oven, down the rear, and then through a flue between the oven bottom and the plate forming the top of the warming closet. The products of combustion then pass upward between the oven and the plate separating it from the fire box. In this way the hot gases pass entirely around the oven before they escape to the chimney. A damper is provided by means of which the area of the opening between the bottom and ascending flues can be regulated.

THE MINNESOTA STOVE COMPANY of Shakopee, Minn., have, we understand, recently increased their capital stock from $50,000 to $75,000.

H. H. WILLIAMSON, representing the Cleveland Mica Company, has just returned from a visit to the East Indies, where he has been purchasing a stock of mica for his company. With regard to the mica industry he is reported to have expressed himself as follows to a representative of one of the Pittsburgh papers: "The finest mica in the world is found in the East Indies, but it is now getting very scarce, and in a few years will play out altogether. I do not know the amount of the annual production, but it is very large, as many European firms, besides those in America, are interested in that field. We are now depending for a good percentage of our material upon the mica producing fields of America."

THE DANGLER STOVE & MFG. COMPANY of Cleveland, Ohio, are the assignees of a patent granted on May 23 to Henry Ruppel of Cleveland, Ohio, for a tank adapted for use in connection with gasoline or vapor stoves. The device consists of an outer and inner tank, the outer one being provided with a false bottom, having a central opening which may be closed by a disk operated by a spring. The bottom of the inner tank also has a collar to which is attached a plug and a valve, also operated by a spring. The object of the invention is to furnish a tank of such construction as to regulate the supply of oil to the burner and also prevent explosion and insure safety in case of accident.

LEWIS F. BETTS of Brooklyn, N. Y., has patented an oil stove so made that all the parts are easily accessible for lighting and cleaning. It is constructed in such a way that the chimney can be conveniently turned upon its hinge and the stove carried about like a lamp, without danger of burning the hand. Mr. Betts has assigned a one-half interest in the patent to the R. E. Dietz Company of New York.

THE KIBLER STOVE COMPANY of Denver, Col., have recently amended their articles of incorporation, making their capital stock $200,000.

A HEATING STOVE of somewhat novel construction has recently been patented by Lyman P. Converse of Chicago, Ill. The fire box is surrounded by an air-heating chamber, having outlets at its base and air outlets in its upper end. The grate is in the form of a cone, the point being some distance above the base. When the fuel is introduced it is suspended in such a manner as to cause the combustion to take place in an outward as well as a vertical direction. The combustion chamber is surmounted by another chamber, the base of which carries upwardly extending sectional rings, which afford an increased heating surface, as well as a circuitous passage for the air entering the chamber at the outer edges and passing toward the central outlet. Pipes lead from the chamber surrounding the fire box to the one surmounting it. Between the walls of the combustion chamber and these pipes space is afforded for the passage of the products of combustion.

THE PLYMOUTH FOUNDRY COMPANY of 90 Union street, Boston, Mass., have been appointed New England agents for the Laurel oil stoves, manufactured by the Art Stove Company, Detroit, Mich.

THE CORNING MFG. COMPANY of Corning, N. Y., favor us with a photograph of the Victor hot-air furnace, shown with the outer casing removed. This heater embodies a number of interesting features, the improvements having been patented in January of the present year. The Victor is a low furnace, adapted for use in low cellars, although it can be used with equal, if not greater, advantage in high cellars, permitting as it does greater angles with a horizontal plane for the hot-air pipes. The furnace has a cast-iron return-flue radiator under the dome, the latter having a cast top and bottom, with cast-iron air flues inside the dome. The object of this arrangement, we understand, is to increase the temperature of the air already warmed by the radi-

ator. The use of improved dampers in the hot-air pipes in the cellar permits the heat to be turned on and off in any room without going to the registers or to the cellar. The furnace has large ash pit, hollow grate bars, which are said to be easily adjusted, and a water pan at the bottom of the furnace.

THE S. M. HOWES COMPANY, 40-46 Union street, Boston, Mass., have issued a neat catalogue of several pages relating to their line of furnaces. Attention is invited to their new top return flue heater, with top radiator cast in one piece and having deep and heavy fire pot, with draw-center grate, and to the Valiant portable furnace, which is offered at a low price. The company call the attention of builders, contractors and architects to the fact that they make a specialty of contract work, and in addition to furnaces offer a large variety of steel plate and cast-iron ranges, fire-place fixtures, heating stoves, laundry stoves, &c. Accompanying the pamphlet is a four-page circular illustrating the Royal Winthrop range.

THE MICHIGAN STOVE COMPANY are circulating among their friends in the trade sheets of blotting paper intended for desk use and bearing upon their faces advertising matter relative to the line of goods manufactured. One of these inscriptions reads as follows: "Don't blot from your memory that Garland stoves and ranges cook food and warm homes for millions, and are the very best that money and ingenuity can produce." At the left hand is a *fac-simile* of the Garland trade-mark, below which is a line reading: "Don't blot with this side."

E. S. ROCKAFELLER, who for a number of years past has filled the position of sales and office manager for the Griswold Mfg. Company, makers of fine hollow ware and stove furniture, at Erie, Pa., will, after July 1, give his entire attention to the Hollands Mfg. Company, in which he is a leading stockholder. Mr. Rockafeller was for a time with the Harker Company of Pittsburgh, who handled the hollow ware made by the Griswold Mfg. Company, after which he went to Erie, where he has been active in building up the business of the latter company.

ONE OF THE FEATURES of Memorial Day in Albany, N. Y., was the gathering in Harmann's Bleecker Hall, where Capt. John Palmer, past-commander of the G. A. R., delivered a spirited and patriotic address. Several national airs were rendered by the Albany City Band Orchestra, and a solo, "The Old Guard," was sung by William A Newton, well known to the stove trade as vice president of Newton & Co. of that city.

HEAD'S IRON FOUNDRY, Utica, N.Y., are distributing an 8-page circular giving testimonial letters from some of those who have used their heaters. The first page of the circular carries a view of the Standard Junior furnace, while the last page shows the Rival Junior.

THE THATCHER FURNACE COMPANY of 33 Peck slip, New York City, report the volume of their business thus far the present year as largely in excess of that for the corresponding period of 1892. This is all the more gratifying, as last year's business was much in excess of that of any other year since the company were organized. The Thatcher furnaces are sold by dealers in all sections of the country and the company are busily engaged in all departments in filling their orders.

A POSTAL CARD, bearing date of June 1, states that the agency for the Jewel and Excelsior gasoline stoves has been transferred to Reeves & Horner of 45 North Second street, Philadelphia, Pa.

THE MARCH BROWNBACK STOVE COMPANY of Pottstown, Pa., issue a postal-card announcement, bearing date of June 1, to the effect that the arrangement heretofore existing between them and F. M. Borden & Brother for the sale of stoves and repairs for the city of Philadelphia and adjacent territory has been discontinued. The company have made arrangements with Reeves & Horner, at 45 North second street, Philadelphia, Pa., to represent them in the locality named.

WM. EARLEY, 1315 Ridge avenue, Philadelphia, Pa., publishes an illustrated circular relating to his heating apparatus. On the front page is shown the Earley steam and hot-air combined portable furnace, a broken view revealing its construction and connections with radiators being shown. The back of the circular illustrates the Earley portable hot-air furnace. The general features of these apparatus are alluded to, and a number of testimonial letters and references are given in the circular.

THE DANGLER STOVE & MFG. COMPANY of Cleveland, Ohio, are the assignees of a patent granted a short time since to Henry Ruppel for a gas radiator. The radiator is constructed with a series of gas jets at the base of the stove flues, means being provided for readily lighting all of the jets at the same time. There is also a spreader so placed as to diffuse the heat after it ascends through the flues. The object of the invention is to provide a light, easily handled radiator for heating by means of gas as a fuel.

BUCK'S STOVE & RANGE COMPANY, St. Louis, Mo., extend a cordial invitation to their friends in the trade to visit their exhibit in Manufactures Building at the World's Columbian Exposition. While they have endeavored to make a display that would attract the attention of every visitor, they have not altogether forgotten the comfort of their friends who will call on them. To the tired dealer the reclining chairs and sofas provided by the company will prove a boon, and should the dealer feel disposed to transact any business, he will find writing materials provided for his use. Letters can be addressed in care of the Buck's Stove & Range Company in the Manufactures Building, which will have their best attention.

THE RINGEN STOVE COMPANY, St. Louis, Mo., manufacturers of the well known Quick Meal gasoline and gas stoves, have from year to year issued a circular diagram better known as the Quick Meal Pie, in which they show the sales for each year since they started in business. During the year 1892 their sales amounted to 54,715 stoves, and a large section of the Pie was necessary to illustrate this number. We are advised that up to May 23 their sales have just reached the entire number sold last year, viz., 54,715; and as there are two months of the season still left, a little calculation will show that the Quick Meal Pie is in imminent danger of being entirely consumed.

THE WILLIAM MILLER RANGE & FURNACE COMPANY, 9 to 11 West Fifth street, Cincinnati, Ohio, favor us with a copy of a 32 page publication which they have issued relating to the Miller-Monitor hot-air furnace, adapted for use in private dwellings, school houses, churches, &c. The goods are claimed to be constructed upon scientific principles "insuring purity of air and the most satisfactory results from combustion, and are absolutely gas tight." The Monitor steel radiator hot air furnace, adapted for ordinary residences, is furnished with patent draw-center anti-clinker grate, and arranged for burning anthracite or bituminous coal or coke. Another heater adapted for use in private dwellings is the Miller-Monitor steel dome return Flue furnace, embodying the latest improvements. The greater portion of the volume before us is devoted to testimonials from some of those who have used the hot-air furnaces made by the company. These letters come from various sections of the country and testify in a striking manner to the satisfaction which the Miller-Monitor goods have given.

WE ARE INDEBTED to the Sill Stove Works of Rochester, N. Y., for a photograph of a very handsome parlor heater which they have just brought out under the name of Silver Sterling. In general appearance and construction it closely approximates their high grade Sterling Ventilator, but is offered the trade at a less price. The Silver Sterling is made in two sizes—No. 41 having a 14-inch fire-pot and No. 51 a fire-pot measuring 15 inches in diameter, one size being offered with oven attachment. In the ornamentation of the Silver Sterling nickel plate has been somewhat liberally employed, and manipulated in such a manner as to produce an appearance suggestive of the name of the stove. The treatment of the skirt and base section is very clever, cast ornament being combined with nickel with pleasing results. The fire-pot and magazine sections are largely composed of open work of conventional design, thus admitting of a liberal use of mica, and giving; when the stove is in operation, a bright and cheerful effect. The dome top is cleverly managed, while the ornament which surmounts the stove adds in no small degree to its appearance. Considered as a whole the Silver Sterling is a heater of which the makers may be proud, and for which there should be a large sale.

THE SYRACUSE STOVE WORKS, Syracuse, N. Y., have made an addition to their line of Welcome stoves and ranges in the shape of a medium-priced parlor heater, constructed with revertible flue and also as direct draft. The manufacturers claim for this heater originality in design, ample flue capacity, satisfactory operation and attractive appearance. The heater, we understand, is of such a character that the company feel confident it will meet with a large sale and prove a successful leader for the average stove dealer.

One of the main buildings of the J. B. & J. M. Cornell Iron Works in this city, located near Eleventh avenue and Twenty-fifth street, New York, was burned down on Friday morning. The fire began in the finishing room, and spread furiously. The loss was estimated at $600,000, which may be too large. The building was full of valuable machinery—punching, drilling and sawing machines, and the rolling mills, one of which cost $75,000. One of the punching machines cost $40,000. There is also a heavy loss on patterns and on a two years' stock of structural iron which was on hand. This is the busy season, and the fire throws about 500 men out of work.

British Tin Plate Exports.

In the June number of United States Consular Reports is published the following abstract of the amount and value of tin plates and sheets exported from the United Kingdom to other countries during the quarter ended March 31, 1893, and for the corresponding quarter of the years 1891 and 1892.

Quantity of Tin Plates and Sheets Exported from Great Britain.

Country.	Month ended March 31—			Three months ended March 31—		
	1891.	1892.	1893.	1891.	1892.	1893.

The report is furnished by Consul Howard of Cardiff, Wales.

The British Imperial Institute.

A great event in the commercial history of Great Britain and her colonies took place recently in London when the magnificent building, known as the Imperial Institute, was opened by the Queen in the presence of representatives from every part of the British Empire. The institution is an outcome of the jubilee celebrations which six years ago marked the fiftieth year of Victoria's reign. It is designed as a kind of focus to draw closer together the ties which bind the mother country and her colonies and dependencies, and, in the words of an official notice, "to be a meeting house for over-seas men when they come home, a show room and exchange for over seas produce, a great practical book of reference for information about every part of the Empire: bringing about a closer connection between its component parts by a variety of interests—commercial, social, intellectual and sentimental." The main scope of the institution is industrial, and the edifice will be a great trading fountain head, where the best and latest information regarding the various portions of the Empire may be obtained. Permaaent exhibitions of goods have been placed there by the governments of all the British possessions, and it will contain an imperial museum. Large and handsome rooms are provided as conference rooms, where the representatives of the colonies may meet on important occasions, as well as other apartments devoted to the social objects of the institute. In these rooms colonists visiting England may, for a moderate subscription, enjoy the advantages of a high-class club, with the other special advantages which the institute is designed to provide. The idea has been enthusiastically taken up in all parts of the British Empire, and the colonists have entered fully into the spirit of the undertaking, the cost of the building, which was nearly $2,500,000, having been subscribed in a few months.

A patent has been obtained in England by F. G. Bates of Philadelphia and W. R. Renshaw of Stoke-on-Trent, England, for a process of coating metals with lead invented by them. By this invention it is claimed that a leaden coating is obtained upon sheets of iron or other metals which is brighter, smoother, harder and more firmly adherent than such coating as hitherto produced. The process is described as follows: The lead is first melted in a suitable vessel, its surface being covered with powdered charcoal, or preferably powdered brick, and the following materials are added to it in the order named: Aluminum, sal-ammoniac, arsenic, borax, or alum or other flux, and cryolite. The proportions it is preferred to use are:

Lead	100 pounds.
Aluminum	5 pounds.
Sal-ammoniac	2 ounces.
Arsenic	½ ounce.
Borax	½ ounce.
Or preferably alum or similar flux	1 pound.
Cryolite	1 pound.

The aluminum will be found to combine with the lead and produce an alloy which is more suitable for coating metal than pure lead. The arsenic also combines with the lead and hardens it, and the other metals act as fluxes to keep the metal surfaces clean and to insure the molten metal taking upon the surfaces. The plates, after being properly cleaned, are passed through the molten metal, as in the ordinary processes.

SCRAP.

A GENERAL STRIKE took place recently at the Carmarthen Tin Plate Works of Thomas, Lester & Co., Carmarthen, Wales. The dispute which led to this action on the part of the workmen was the right of their employers to impose fines for breakages. Two rolls had been broken by two of the millmen, for which they were mulcted in the amount of £1 apiece. The workmen demanded that the fine should be remitted, which was refused by the manager, on which a general strike of the employers took place. The experiment of overlooking breakages was tried for some time at the Carmarthen works, but it is said to have been a failure, resulting in serious loss.

THE WORKS of the Blairaville Rolling Mill and Tin Plate Company, Blairaville, Pa., are reported to be very busy in both the rolling mill and tinning departments. The demand from other concerns for American black sheets for tinning purposes has taxed their resources to keep abreast of orders in this line. Their output of tin and terne plates continues to the utmost capacity of the plant, and all the product is said to find a ready market in the vicinity. James B. Scott & Co., Pittsburgh, Pa., are sole factors for the Blairaville mills.

RUMOR ASSERTS that tin-plate manufacturers are anticipating some difficulties with their workmen in regard to wages. Tin-house men contemplate, it is said, demanding an advance, to date from July 1.

The Legislature of Cyprus has decided to introduce railroads into that island. The prosperity of the protectorate has been much hampered hitherto by inadequate means of internal communication, and it is hoped that the provision of railroad facilities will give it the necessary stimulus. Cyprus is a large producer of grain of various kinds, linseed, wine, oil, silk, cotton and salt, and there are mineral resources in the island yet undeveloped.

The Sheffield technical school, in England, which languished for several years is now prospering, both in the engineering and electrical departments.

TRADE REPORT.

The Iron Market.

The Iron and Steel trade is still under a cloud, which those who are pessimistically inclined claim to be getting blacker. The situation shows very little change from last week, but the feeling is probably of a more settled character, and to that extent there is improvement. There is a pretty fair demand for nearly everything in small lots, quick delivery, but there are no new or important orders on the market. Thus far indications are that the different wage scales will be ready for presentation to the manufacturers much earlier this year than ever before, and should no serious trouble occur between the manufacturers and the workmen, the new scales will have been formulated and signed before the ones now in force have expired. The Chicago market is seriously affected by financial disturbances, and, while the panicy feeling is largely confined to the poorer classes, business men are concerned over the situation.

Pig Iron.—New York sales agents report a very dull market, although there have been no indications in the territory tributary to this city of the exceptionally low sales for quick delivery and for cash, which are spoken of as having taken place in other markets. We quote Northern brands at $14.50 @ $15.25 for No. 1; $13.75 @ $14.50 for No. 2, tidewater. Southern Iron, same delivery, $14 @ $14.50 for No. 1; $12.75 @ $13.50 for No. 2, and $13 @ $13.50 for No. 1 Soft.

There is not much business doing in territory tributary to Philadelphia, so that it is difficult to say whether the market is better or not, or to what extent it is better. Those who have Iron for sale are asking the full prices of last week; and as stocks are in good shape, there is no necessity for forcing material on unwilling buyers. Buyers and sellers alike are trading from hand to mouth at about the following prices delivered for Philadelphia or equivalent points, and 20¢ @ 30¢ less on brands at Harrisburg, and intermediately to Baltimore:

American Scotch, No. 1X	$16.00	@ $16.50
American Scotch, No. 2X	15.00	@ 15.50
Lake Superior Charcoal	$16.50	@ $17.00
Local Coke Foundry, No. 1	14.75	@ 14.25
Local Coke Foundry, No. 2	13.00	@ 13.25
Local Coke Foundry, No. 3	12.75	@ 13.00
Local Scotch	14.00	@ 15.00

We learn from Chicago that consumers are curtailing their requirements and trade is light, running only to small lots for immediate shipment. Concessions may perhaps be obtained on our quotations, but in the absence of transactions to test values we make no change. Quotations are as follows, cash, f.o.b. Chicago:

The Pig-Iron trade in Southern markets has been light all the week, and, while there is no quotable change in prices, the general tone of the market is easy. There continue to be applications to hold back deliveries on maturing contracts, and there is no disposition to buy in advance of consumptive necessities. There is no demand for Charcoal Iron, and prices are little better than nominal. Quotations are as follows:

Foundry.

Southern Coke, No. 1	$13.00	@ $13.25
Southern Coke, No. 2	11.50	@ 11.75
Southern Coke, No. 3	11.00	@ 11.25
Ohio Soft Stone Coal, No. 1	16.00	@ 16.25
Ohio Soft Stone Coal, No. 2	15.00	@ 15.25
Lake Superior Coke No. 1	15.00	@ 15.25
Lake Superior Coke No. 2	14.00	@ 14.25
Hanging Rock Charcoal, No. 1	18.50	@ 19.00
Hanging Rock Charcoal, No. 2	17.50	@ 18.00
Tennessee and Alabama Charcoal, No. 1	15.00	@ 15.50
Tennessee and Alabama Charcoal, No. 2	14.00	@ 14.50

Metal Market.

Pig Tin.—There has been a slight turn for the better in the surface appearances of the market, but the turn looks feeble rather than healthy, suggestive, in fact, of nicely timed manipulation calculated to stiffen the backbone of buyers who are now receiving Tin on old contracts purchased at prices considerably below those at which supplies can be secured at the present time.

Copper.—Immediately after the writing of last week's report, exporters closed contracts for about 1,000,000 lb of Lake Superior Ingot at, it is understood, 11¢ ₮ lb. Since then there has been nothing done outside of ordinary home trade transactions, involving comparatively unimportant quantities. Current prices are about 11¢ for Lake Superior Ingot, 10½¢ @ 10¾¢ for Electrolytic and 10¢ @ 10⅛¢ for common Casting brands.

Pig Lead.—The upward movement that characterized values last week has given place to a turn in the opposite direction and the market is at present in a somewhat perturbed condition, being affected to greater or lesser extent by financial complications in Western trade centers, as well as extreme reserve on the part of consumers generally. At the close the market was soft, with sellers of round lots at 3.80¢ for July and 3.82½¢ for later delivery.

Spelter.—The Kansas coal mining labor troubles have served to keep the market in a somewhat feverish condition. The popular quotation for deliveries at this and common Eastern points is 4¼¢, but the chances are that attractive orders could have been filled at a shade less.

Antimony.—Demand has been slow and prices are easy, with Hallett's, quoted at 9¾¢ @ 9¾¢, L.X. at 10¢ @ 10½¢ and Cookson's at 10⅝¢ @ 10¾¢, in wholesale lots.

Tin Plate.—There has not been the slightest improvement in the demand. Spot goods have been taken in moderate quantities only and futures are still practically neglected. Values are rather soft nearly all along the line, yet showing no radical change. The demand for Tin Plates from consumers is limited, with unchanged prices.

Chicago Report.

Scrap.—Old Material is absolutely neglected. Dealers quote buying prices as follows:

	Per net ton.	Per lb
No. 1 Wrought Scrap	$12.00	....
Machinery Cast	9.00	....
Malleable Cast	7.00	....
Stove Plate (free of burnt)	6.50	....
Burnt Iron and Grate Bars	4.00	....
Sheet Iron and Hoops	3.00	....
Plow Steel and Breaking Stock	8.00	....
No. 2, such as Shovels, Hoes, &c.	4.50	....
Old Boilers—whole (Iron)	7.00	....
" (Iron)—cut in single Sheets and Rings	10.00	....
Old Gas-Pipe and Boiler Tubes	7.50	....
Cast Borings	4.00	....
Turnings	5.50	....
Horseshoes	12.00	....
Copper Bottoms	....	8 ¢
Copper Clips and Heavy	....	9 ¢
Heavy Brass	....	8 ¢
Light Brass	....	4 ¢
Pipe Lead	....	3 ¢
Tea Lead	....	2¾¢
Zinc	....	3 ¢
Rubber	....	2¾¢

Anthracite.—Quotations on carload lots of 12 net tons are as follows:

	Egg, Grate.	Sto. and Ch.
Chicago, Ill.	$5.60	$5.85
Milwaukee, Wis.	5.60	5.85
Kansas City, Mo.	8.80	9.05
Council Bluffs, Iowa	8.80	9.05
Lincoln, Neb.	8.95	9.20
Sioux City, Iowa	8.80	9.05
Aberdeen, S. Dak.	8.85	9.10
Dubuque, Iowa	6.90	7.15
Madison, Wis.	7.10	7.35
St. Paul, Minn.	8.10	8.35
Burlington, Iowa	7.10	7.35
Des Moines, Iowa	8.55	8.80
Davenport, Iowa	6.90	7.15

Leavenworth, Kan.	8.80	9.05
Omaha, Neb.	8.80	9.05

Colorado Anthracite.

COLORADO FUEL & IRON COMPANY.	
Denver	$8.00
Pueblo	8.00
Colorado Springs	8.00
Leadville	8.00
Cheyenne, Wyo.	10.00
All points between Denver and Missouri River	9.35

The packing of kerosene in inferior cans results in leakage, and other merchandise is liable to serious damage.

CONDITION OF THE

Hardware Trade.

There is little change in the volume of business since our last report. It is evident that a fair amount of goods is being distributed by the jobbers throughout the country, but trade on the whole is rather quiet and of less volume than was expected earlier in the year, and the general expectation is that business for the next month or two will be dull. Buyers are placing orders only for pressing and early requirements, the uncertainty in regard to the financial situation being the principal feature of the market at present. Prices are naturally inclined to droop, but manufacturers are wisely refraining from forcing their goods on the market. There is a good deal of complaint in regard to collections, but in this respect the situation is not more unsatisfactory than for several weeks past.

Advices from Chicago.—The Shelf Hardware trade again improved during the past week, Monday's mail being decidedly heavier at the jobbing houses here than had been the case for several months previous. The improved demand has extended to all classes of goods, regular Hardware showing a decided increase, and Builders' Hardware moving much more freely. Trade in seasonable goods is now quite heavy, but staple goods, such as Nails, are still comparatively neglected. Heavy Hardware keeps up unexpectedly well, manufacturing consumers buying better than it was supposed they would this month. Collections show an improvement, but this may perhaps be due to the fact that the first of the month has just come in. The whole situation is better in every respect.

Notes on Prices.

Cut Nails.—The market in Cut Nails is weak. The price in the East is represented by the quotation of $1.05 for carload lots at mill, but it is understood that this figure has been slightly shaded. The weakness developed in Wire Nails has its effect upon Cut Nails, and the manufacturers of the latter are hoping that the Wire Nail manufacturers may be able to reach some understanding by which prices will be put on a better basis. Small lots of Cut Nails from store in New York are held at about $1.35.

Advices from Chicago,.—Cut Steel Nails show no new developments. Manufacturers are not competing so vigorously for orders, and the small volume of trade now coming up in a natural way is taken care of easily by the local makers. Factory lots are nominally quoted $1.25, but prices are not strong. Small lots are selling from stock at $1.35.

Wire Nails.—During the past week or ten days Wire Nails have been selling at considerably lower prices than have ruled for a long time. Some round lots have been quoted at $1.35, f.o.b. mill, and it is even intimated that this figure has been slightly shaded. This recession in price is accounted for in part by the fact that the mills had pretty well cleared up their orders and were desirous, as far as possible, of avoiding the accumulation of stock. The fact that some large jobbing houses had considerable stocks of Wire Nails purchased at old prices, so that they could compete with or undersell the manufacturers, had also its influence in inducing this weakness. The present situation is very unsatisfactory to the manufacturers, and there has of late been a good deal of conference with reference to measures which might be adopted to regulate prices and production. A largely attended meeting of the Wire Nail manufacturers was held at Cleveland on Thursday. It has been decided, we are advised, to shut down the mills during the entire month of July. It is thought that the manufacturers are more disposed to make mutual concessions, with a view to securing a satisfactory arrangement among themselves, than when such an attempt was last made.

Advices from Chicago.—Manufacturers' agents report a larger business in Wire Nails, but this is made up of numerous transactions in carload lots, heavy buyers being conspicuously absent from the market. Prices are somewhat weaker, and while $1.50 is the regular price on factory lots, concessions have been made by some of the mills desiring to convert their stock on hand into cash. Jobbers report their trade quite light at present, but continue to quote on small lots $1.65 to $1.70, making some concession to best buyers.

Barb Wire.—There is little change in the Barb-Wire market. Quotations are on a basis of $2.45 to $2.50 for Four-Point Galvanized in carload lots at mill. Small lots delivered in New York are quoted at $2.70 for Galvanized and $2.30 for Painted.

Advices from Chicago.—Barb Wire has been in somewhat better demand from factory, but carload prices have weakened to $2.15 for Painted and $2.55 for Galvanized. Painted is in much better supply than Galvanized, as the demand for the latter still continues to gain on the former. Jobbers report only a small trade from stock and maintain quotations at $2.30 and $2.70, respectively.

Binder Twine.—For the past two or three weeks there has been more or less uncertainty in the Binder-Twine market, resulting largely from the possibility of a shortage. Arrangements have now been made, it is understood, by which the Twine held by banking concerns, as collateral, may be released and put upon the market. The warmer weather for the past few days has increased the importance of prompt shipment of Twine, and the tendency is toward stiffer prices. The withdrawal of the National Cordage Company, as a factor in the trade, has had a tendency to increase the business of outside factories to a considerable extent.

Stove Polish.—The Raven Stove Polish Company, 59–61 Lake street, Chicago, Ill., are quoting their Polish at the following net prices:

Raven Liquid:
6 oz. Bottles, per gross.....$8.00
8-oz. Bottles, per gross..... 9 00
Water Polish, large boxes, per gross 7.20

These goods are put up in ¼ and ½ gross cases. Raven Paste Polish is put up in 5-pound pails, in cases of 6 and 12 pails, upon which prices are made according to the number of pails ordered.

Mica.—The movement in this commodity in connection with the stove trade may be alluded to as moderate at present, being between seasons, except for oil stoves, for which there is still some inquiry. Shippers of ranges and heating stoves will not need the goods for a month or two. For electrical purposes there is more activity. Prices are well maintained and orders have been declined from buyers in good standing at even slight concessions. The opinion is advanced that from now until the end of the year the demand will fully equal what can be produced.

Tinware.—Manufactured Tinware as well as Enameled Ware is in good demand; the trade, with few exceptions, referring to the volume of business as large, although is seems to be true that excessive competition is enabling buyers to supply their wants at very slight advances on cost of production. Net prices are still given when quotations are made.

Conductor Pipe.—Such demand as is being made for this class of goods is being supplied on about the same terms, there being no changes of moment.

Sheet Iron.—Black Sheets remain about the same, with but little change either way, and but a fair amount of goods changing hands. Galvanized Sheets are more active, as is usual at this season, and much trade is being done, with a tendency to shade prices where the quantity is an inducement, although some buyers affirm they are unable to supply their wants at any concession.

Tin Plates.—Trade in this line among importers and jobbers appears to be moderate in amount, as small manufacturers are absorbing but little beyond current needs, while the larger producers supply themselves directly from the mills whether foreign or domestic. Stocks in this market are said to be light and not of a speculative character, with comparatively little owing on them, so during the period of contraction there is little pressure to force sales.

Cordage.—The Cordage market is characterized by a somewhat firmer tone and slightly advanced quotations. The base prices for large lots, f.o.b. factory or New York, are as follows:

	Cents.
Manila	8¼ to 8¾
Sisal	7¼ to 7½
New Zealand	6½ to 6¾

Some of the companies connected with the National Cordage Company are re-entering the market. In the meantime negotiations are progressing with reference to a reorganization, but nothing definite in this direction is yet announced.

Paragon Rotating Washer.—Olds Wagon Works, Fort Wayne, Ind., are the manufacturers of this Washer, which is sold to the trade at $42 per dozen.

Glass.—The situation in the Glass market is practically unchanged, and remains about the same as reported last week. The more favorable weather for building has not increased the demand for Glass from factory to any considerable extent, although dealers report an increase in inquiries for Glass for fall delivery. Restrictions in credits are becoming almost universal, and conservative dealers are satisfied with furnishing Glass to only those from whom prompt returns may be expected. The times do not seem favorable for an increase in list prices, especially as importers do not appear disposed to consider propositions made by the National Window Glass Company. The Window Glass involved by the failure of ex Secretary Foster, which, it is stated, amounts to about $75,000, will probably be put on the market at much lower prices than the official discounts would allow. The productive capacity of Glass is being decreased by pots and tanks going out each week, which is a condition to be expected at this time of the year. Although the demand for Plate Glass has increased, it is intimated that the stock at the various factories is sufficient to meet the demand for months to come, and production is being curtailed by not starting up factories again by the National Plate Glass Company after stock taking was finished. Quotations remain unchanged as follows: American Window Glass, 2000 boxes at one time, 80 and 10 and 10 per cent. discount; carloads, 400 boxes, 80 and 15 per cent. discount; less quantities than carloads, 80 and 10 per cent. discount. Freight allowed on car lots and over, not to exceed 17½ cents per 100 pounds; less than car lots, f.o.b. at shipping point. French Window Glass, 75 and 10 and 5 per cent. discount. American Plate ranges in price from 50 and 10 and 7½ per cent. discount to 60 and 5 per cent. discount. Imported Plate Glass, 60 per cent. discount to 60 and 10 and 5 per cent. discount.

Trade Notes.

THE J. A. FAY & EGAN COMPANY of Cincinnati, Ohio, have recently been favored with a large order for machinery to go to Padang, Sumatra, Dutch East Indies. From this it would seem that the "Dutch" are in favor of American wood-working machinery, and the indications appear to be that more will follow. The company have recently adopted a new business card, which is unique in its way. On one side is the name and address, a list of purposes for which the company's wood-working machinery is specially adapted, the names of officers and directors, together with a *fac-simile* of the decoration of the Legion of Honor conferred by the French Government at the Paris Exposition. On the other side of the card is an engraving representing a bird's-eye view of the company's immense plant; also a list of grand medals of honor awarded for the displays of machinery at various expositions.

IN OCTOBER, 1892, E. S. Wheeler & Co., New Haven, Conn., covered the roof of the South Dakota Building, at the World's Fair, with Gilbertson's Old Method Tin Plate, using 24 boxes, 20 x 28, which was taken out of Chicago stock and put on unpainted and without special preparation. In this condition it passed through the severe winter, resisting unusually adverse atmospheric conditions and is now, we understand, as bright as when put on.

LALANCE & GROSJEAN MFG. COMPANY, New York, have received some unusually large orders for Enameled and Tin Ware within the last few weeks from Brazil. That country is said to be again becoming an important customer in these goods with the improvement in her financial condition. On the other hand the trade with Buenos Ayres has fallen off materially of late in consequence of troublous times in the Argentine.

IN OUR ADVERTISING COLUMNS there is a rather startling announcement headed "Confession." The substance of it is a letter addressed to the Kelsey Furnace Company, Syracuse, N. Y., from a firm of engineers and steam-fitters who refer to the excellent results obtained with a Kelsey No. 24 furnace. The special point they make is that this furnace more nearly approaches a steam plant in the area of heating surface for warming the air. The Kelsey Furnace Company report an excellent trade thus far this year, it being 100 per cent. ahead of the same period a year ago. The contracts on hand assure them that they will be able to place every furnace they can produce before January 1 next. They especially allude to the feature of their positive attachment as giving them a strong hold with the dealers.

THE RUTLAND FIRE CLAY COMPANY of Rutland, Vt., turn out a fine grade of Stove Linings, which are the subject of a very complimentary article printed in a recent issue of one of the Chicago papers.

A PICTURE OF A RAVEN, one of the most intelligent of winged creatures, and at the same time remarkable for the single color of his plumage, is a striking feature of the announcement of the Raven Stove Polish Company, 59-61 Lake street, Chicago, Ill., that appears elsewhere. The picture, however, is only incidental to what the company say of their goods, as the subject of the advertisement is the thing the trade is really interested in. The merits of the Raven Paste Polish are alluded to, and it is said that it has met the approval of over 150 large stove manufacturers and jobbers. The manufacturers allude to the excellence of their polish, which they say is manufactured from the cleanest and most excellent graphite taken from their mines at Sonora, Mexico. The company have been forced to re-equip their manufacturing plant with the most improved modern appliances, and they say they are now in position to take care of their trade in the best possible way. The firm also manufacture a domestic water polish, put up in non-corrosive rubber-lined boxes, which has an excellent sale. A clever advertising plan that they are responsible for is a mechanical figure in the show window of the Siegel Cooper Company's store in Chicago, which shows a woman blacking a range.

THE NEW YORK WIRE CLOTH COMPANY'S FACTORY, at Hamilton, N. Y., was almost totally destroyed by fire about 5 a.m., June 3. Of 100 looms in operation 75 were burnt, those remaining being of an old pattern and of little use. The loss, although not yet ascertained, is fully covered by insurance. The company will now run their Homer, N. Y., plant night and day, and expect to experience but little difficulty in executing existing contracts. Fortunately, some two weeks ago they started up their Brooklyn, N. Y., factory, and since that time have been weaving as well as painting cloth at that point.

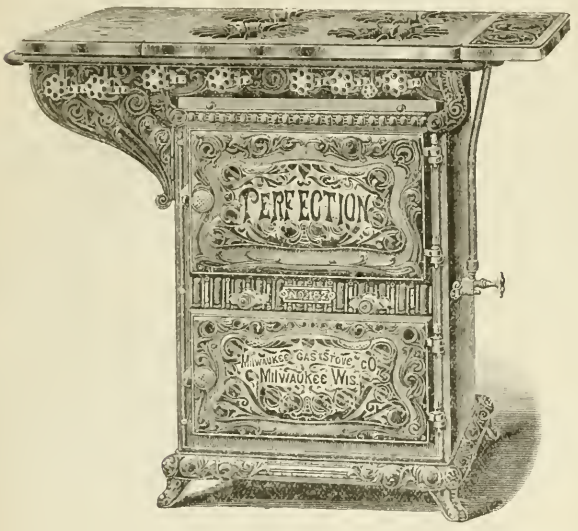
AN ATTRACTIVE announcement is made elsewhere by the Safety Furnace

Pipe Company, Detroit, Mich, who show a stack of Pipe in position by means of an outline drawing ; also some of their special fittings.

THE COPPERSMITH WORKS of Engel, Kirchnie & Regnier, at Baltimore, Md., has been destroyed by fire causing a loss of $33,000.

New Perfection Gas Range.

An illustration is herewith given of a new gas range brought out by the Milwaukee Gas Stove Company of Milwaukee, Wis. It is a four-hole range, with water heater, manufactured with sheet-steel back and sides, and adapted to natural or any manufactured gas, including gasoline gas. It is of good



New Perfection Gas Range No. 182.

size, the top plate, including shelf, measuring 40 x 24 inches, hight 35 inches, baking and roasting ovens 18 x 18 x 11 inches, and broiling oven 18 x 18 x 10 inches. Special features are patented self-cleaning burners, adjustable valves for regulating pressure, special burners for ironing, simmering burner, telescope oven burners, which can be lighted and regulated from the outside, and water coil made of seamless drawn copper tubing. Cooking can be done over the water coil while water is being heated for the boiler. The front is of handsome design, in keeping with the fine finish of the working parts.

Maris & Beckley of Philadelphia, manufacturers of cranes and hoists, report business in their line particularly brisk. The orders for traveling cranes at present in hand are heavy and necessitate the running of their shops at their fullest capacity. During the past year some improvements have been made in their Teal portable hoist. In its present shape the demand for the hoist has considerably increased, and the firm state that they find it difficult to keep up with the orders.

The Oldest Railroad Man.

There lives within a few miles of Charleston, W. Va., an individual who, according to local report, is probably the oldest railroad man in the world. He is Rev. Ralph Swinburn, a Baptist minister, who, on the authority of the *Daily Gazette* of Charleston, was associated with Robert Stephenson when that engineer constructed in England the first locomotive and operated the first railroad in 1825. Mr. Swinburn, when a young man, is said to have actually run Stephenson's first locomotive as engineer, and to have been superintendent of the road on which it was run—the Stockton & Darlington. He was occupied in railroading for 25 years in his native country, and for several years in the United States, to which he emigrated in 1850. Retiring from railroad business, he took to farming, and was ordained a Baptist minister in 1856. These occupations he has followed ever since. Mr. Swinburn is 87 years old, and is described as very active for a man of his advanced age, preaching regularly and managing his farm.

The Chambers Brothers Company of Philadelphia have just issued a 32-page catalogue and price-lists of the Waldron flexible friction clutches. The company claim to have given in the lists a very conservative rating of power for the different sized clutches, their aim being to give the customer a large margin within the actual slipping point under ordinary circumstances.

The Stow Flexible Shaft Company of Philadelphia find their manufacturing facilities taxed to the utmost to keep up with orders received for shafts for cleaning castings, for emery wheels and for other purposes. They have received quite a number of orders from the Government Navy yards for shafts to be used in connection with electric motors.

Evolution of the Steam Fitter.

As soon as gas is introduced into a country town the tinner is called upon to do the work of piping the houses. Having saved his money and added successively a line of stoves, hardware and house-furnishing goods, besides having had to do some plumbing, he now good-naturedly buys the necessary tools and fittings to do this line of work. Though new to him, he studies the principle and accomplishes satisfactory results. His knowledge of cutting, fitting and running pipes now brings the factory, mill and power-plant man to him with work that taxes his facilities to their limit, and he naturally extends them until he can handle pipe for his gas and pump work up to two and a half inches and furnish the necessary supplies. While this expansion has been going on in his shop, the information that has been crowding into his mind and the experiences that he has had, not all of which have been as pleasant as they have been educational, qualify him to receive the steam or hot-water salesman with intelligent interest.

The Heating Salesman's Field.

A salesman selling steam and hot-water goods would have a very restricted field if he did not visit the country towns of good size, and he could not hold his position if he only went where a full-fledged specialist in steam fitting was known to carry on that business. Probably no keener hunter exists than the salesman, and that he finds game in the country tin-shop, plumbing shop and hardware store reflects to the credit of the trade from either standpoint. It is true that his new customers tax his energy from their lack of acquaintance with many of the all-essential principles. If he, however, is a past master in the science of determining the flow and return and branches, simple rules can be given that will insure proper distribution of the heating medium and the correct exposure required for varied cases.

Heating and Ventilation.

While the humble installer of heating plants may be successful in heating ordinary buildings, those of greater proportions and requirements may be beyond his scope. If the architect is not a specialist in the science of heating and ventilation, he must consult the expert of the house from which he buys his goods, or seek the information from another laborer in this field who will lay out the whole work, with drawings and a list of everything that is required. The sound common sense of employing such help rather than struggling with a problem for which only a moderate preparation has been made is too clear to need further emphasis.

The Sun Spots

There has recently appeared upon the face of the sun an unusually large group of sun spots, remarkable not only for size, but for the suddenness with which they made their appearance. Just how far the amount of heat which reaches the earth from the sun is affected by the presence of such a notable quantity of spots as are now to be seen has never yet been determined, but it is generally accepted by astronomers that such spots are caused by cooler gases of combustion upheaved through a mass of much higher temperature; and, if this be true, the effect may be, on a large scale, analogous to placing a quantity of imperfectly heated coal from a fire that has nearly gone out upon the top of another glowing fire in a grate. The result is that a much less quantity of heat is emitted until the added fuel becomes thoroughly ignited again. Whether the remarkably cool spring we experienced had relation to a less amount of heat reaching us from the sun, as indicated by the presence of the spots in question, is something that cannot be definitely determined, but it is always interesting to connect the spots on the sun with changes in climatic, political or industrial conditions. It affords such ample opportunity for surmises that every one can develop a theory and get amusement for a lifetime in endeavoring to prove it.

Restrictions on Welsh Tin-Plate Production.

For some time past the question of restriction in the output of tin plates has been causing considerable friction between employers and employed in some of the Welsh tin plate manufacturing districts. In the interests of the workmen the Tin Platers' Union has decreed that 36 boxes is to be the limit turned out in one shift, this restriction being deemed necessary for the purpose of giving work all round and keeping the factories going; and in the present dull state of the market it has not been found difficult to induce the majority of manufacturers to permit the observance of this limit. But when busier times come, with increase of demand for tin plates, employers will, naturally, object to being tied down in this manner. They argue that it is contrary to reason where, as is the case with numbers of works, it is possible for the men to turn out from 60 to 70 boxes per shift, that they should be restricted to little more than half their capacity by such an iron-bound rule. In the Llanelly district, particularly, the hardship to the employers is much felt, as many of them have lately been to great expense in providing machinery and preparing for a large output, which outlay will be of no avail should they consent to the limitation dictated by the workers' union. Besides, they justly hold that such restriction, if imposed at all, should be general. This, however, is not the case, some manufacturers having, as we understand, refused to accept the demand of the union and are employing non-union men. Just at present matters in Wales are reported as being pretty quiet, owing, presumably, to the general flatness of business which has lately prevailed. But labor difficulties are likely to crop up in the future in regard to this point, both parties appearing resolute in maintaining their side of the question.

Anti-Trust Convention.

The great Anti-Trust Convention, which met in Chicago last week, with representatives from nearly all the States in attendance, was a failure. There was considerable discussion and sundry resolutions were passed, but they will not hurt anybody. The action taken by the regular convention presided over by Governor Nelson of Minnesota was too tame for some of the radical reformers, so they bolted and held a convention of their own. The familiar name of Gen. J. B. Weaver of Iowa appears as president of this convention. Both bodies made provision for continuous work against trusts hereafter. At one time the prospects were very favorable for effective work in arousing public sentiment in this way against combinations, but somehow the movement has fallen flat, and it will be singular, indeed, if the June Anti-Trust Conventions are remembered with more than languid interest when Congress assembles.

Unofficial advices from members of the American commission at Paris in connection with the Behring Sea arbitration do not give any hope of an early termination of the present proceedings.

The Waste of Anthracite.

Consumers of anthracite coal have a deep interest in the question which has been agitating the men of broad views among the colliery owners: How to lessen the waste in mining, preparing and burning of anthracite coal. It is only very recently that manufacturers on the seaboard, who have grown accustomed to make each succeeding purchase and sale at lower prices, have received with astonishment the announcement of an advance in the small sizes of anthracite coal, due to the greatly increased consumption. It has been often remarked that anthracite coal is altogether too precious a fuel to be dumped into a blast furnace, or be shoveled under a boiler. It may not be long before its industrial uses are confined to the sizes which cannot be burned in domestic fires. The territory which now depends upon anthracite as a manufacturing fuel must secure cheap coal, if it is to live in competition with other sections more highly favored. For that reason general interest attaches to every effort to reduce waste in the production and utilization of anthracite coal.

In 1889 the Legislature of Pennsylvania passed an act creating a commission to investigate the waste in coal mining, there being appointed J. A. Price of Scranton; Peter W. Sheafer of Pottsville, and Eckley B. Coxe of Drifton, Pa. The death of the two first named caused a good deal of delay in the work, Heber S. Thompson and William Griffith taking it up with Mr. Coxe, to whose earnest endeavors its completion is principally due. A neat volume just issued is the fruit of the labors of the commission. By far the greatest part of the report deals with questions touching chiefly the interest of producers. Thus an investigation is published concerning the probable percentage of the coal originally deposited in Eastern Pennsylvania which was left in the ground when the mining of anthracite first began. A. D. W. Smith figures out that it was 19,500,000,000 tons, of which 17,245,000,000 tons of marketable coal is still in the ground. It is estimated that the total coal won will not exceed 40 per cent. thereof, so that the supply is figured at 6,898,000,000 tons. With a production now of about 42,000,000 tons annually the future seems pretty well assured.

The commissioners deal carefully with the different sources of waste, unavoidable and otherwise, in the mining, the preparation and the shipping of anthracite coal, and note the improvements which have reduced it. They justly pronounce the most important saving of waste that due to the better utilization of the smaller sizes. Interesting experiments were conducted by John R. Wagner in the testing laboratory of Coxe Bros. & Co., on the burning of small coal with a forced draft. The conclusions are summarized as follows:

1. That the ashes produced by a steam jet were never as low in carbon as those produced by the fan; that is, an appreciably larger per cent. of the carbon was utilized by the fan blast. This appears to be due to the fact that when the carbon in the ash over the grate is reduced to a certain point the steam dampens it somewhat, and it ceases to burn sooner than it does when dry air only is blown through it.

2. That with the fan blast the rate of combustion per square foot per hour is greater than with the steam jet.

3. It was found that where a bed of coal was ignited and burned out, the percentage of carbon in the ash is much less than where coal is successively added to the burning mass. In practice it is not generally possible to allow the bed to burn out sufficiently before adding the cold, unignited coal. The result is a damping down of the fire, which causes the ash to cease burning sooner than it would do if there were no reduction of temperature and checking of the draft due to the adding of the coal.

4. There seems to be no doubt that the introduction of steam into the ash pit decreases materially the tendency of the coal to clinker on the grate in comparison with the fan blast or natural draft. It also changes the color, volume and character of the flame and increases the distance that the flame extends beyond the bridge wall. In many cases it is not practical, or at least it is very difficult, to burn the smaller sizes of coal without the steam jet on account of the clinkering. This effect of steam on clinkering is probably due to the fact that the steam, to a certain extent, moistens the ash close to the grate and prevents the ash from reaching there as high a temperature as it would with dry air. It is also probable that the decomposition of the steam into carbonic oxide and hydrogen, which takes place to a certain extent, and which, of course, is accompanied by a reduction of temperature, tends to prevent clinkering. The decomposition of the steam, accompanied by the formation of carbonic oxide and hydrogen, will probably account for the difference in the flame referred to.

5. A careful study of the burning of culm—that is, the burning of small coals with more or less dust in them—in these and other experiments, seemed to show that in almost all cases it is accompanied by a very high percentage of carbon in the ash, which analysis showed, in some cases, reached 58 per cent. Unless special precautions are taken to prevent it, a large portion of the fine coal runs down through the grate. When the culm gets red hot it acts almost like dry sand and works its way into the ash pit, thus increasing largely the percentage of carbon. Where coal has to be transported any distance, the value of the culm at the mines being very small, it is probable, from the investigations made, that it would be cheaper to remove the dust and transport only the larger coal.

6. It has been found that the percentage of iron pyrites, which occurs to a greater or less extent in all coals, increases very rapidly with the smallness of the coal. This is due to the fact that the iron pyrites occur generally in thin layers or incrustations on the coal. These thin layers are broken off and pulverized in the preparation and handling of the coal, and are therefore found to a much greater extent in the very small coal. It is, of course, well known that the presence of iron pyrites in fuel is very undesirable, as it generates sulphurous acid and has a tendency to destroy the grates or other iron work around the boilers, besides in many cases increasing the tendency to clinker.

7. That while the fan blast produces the best ash and gives a more perfect rate of combustion, yet in many cases it is more advantageous to use the steam blower on account of the clinkering, which may cause very serious trouble. In certain localities, particularly in cities, the noise of the steam blower is sometimes a disadvantage.

8. While it is not positively demonstrated, it is thought that the question of mixing small coals from different veins or different localities is a matter of importance. It would appear that sometimes two coals, each of which, when burned separately, gives reasonably satisfactory results, when mixed together clinker and give trouble, probably because the ash of the combined coals forms a much more fusible silicate than either of the ashes separately.

9. It would seem that the combustion of the small anthracite is more perfect when the coal remains undisturbed, or as nearly as possible in the condition in which it was put in the fire, instead of being turned over, so that the partially consumed and the unconsumed coal are mixed together.

When consumers learn to appreciate the fact that the furnaces and their appliances must be made to suit the fuel, the economical use of the smaller sizes of anthracite for manufacturing purposes will become more general, and important manufacturing interests will be favorably affected.

The Practical Mechanic and the Plumber.

BY JOBS.

A disagreeable leak had become manifest and word was sent to the plumber to come and find the cause of it and put a stop to it. He came, with gasoline fire pot, solder pot and a bag of tools, and on investigation found a piece of pipe several feet long as thoroughly perforated as a well worm-eaten log; but, fortunately, a stop cock was placed near by for shutting off the flow of water through this pipe.

The plumber explained to the lady of the house that a piece of lead pipe of considerable length would have to be put in, and that he would leave the floor just as he had torn it up until he could get the pipe, but as it was near night he would not return till the next morning. This the lady deplored, as she did not want her house to look like a workshop and could not see why he did not mend the old pipe, but supposed a plumber had to put in something new to make the bill larger.

In the evening she told her troubles to the professional gentleman who was her beloved, and who, in sympathy, told her he would investigate. So, clothed in an old smoking jacket, he proceeded to the scene of trouble and carefully searched the offending pipe, from the point where the leak had first furnished an uncalled-for water supply clear to the stop cock. The pipe was perfectly dry, without any moist evidence of a defect in it. His wife had been a witness to the entire proceeding, and now, with impressive dignity, he told her to explain to the plumber that he was something of a mechanical expert and had considerable skill in practical mechanics, which enabled him to penetrate the scheme that was to be worked, and he would treat any extortionate bill accordingly.

In the morning, immediately on the appearance of the plumber, the good wife conveyed this information with a force well calculated to annihilate, and with a "there now!" pause waited for the response, which was: "Couldn't find the leak, eh? and is an 'expert practical mechanic,' hum! Well, why didn't he open the stop cock?"

It is reported that a special effort will shortly be made by the Mexican Government to induce immigration. A circular letter has been sent out to the land owners requesting them to make efforts to that end.

The Foundrymen's Association.

The regular monthly meeting of the Foundrymen's Association was held at the Manufacturers' Club in Philadelphia, on Wednesday, May 7, with a large attendance of members. Francis Schumann was chairman. The minutes of the last meeting were read and adopted. The Executive Committee reported that at its last meeting the state of the foundry trade was fully discussed. It was found that collections were very difficult to make, owing probably to the fact that banks were refusing credit without gilt-edged securities, and were asking for additional collaterals for advances already made. It was noticeable that some of the large manufacturing concerns were the slowest pay, while the small operators found it necessary to make prompt settlements in order to establish a good name. Regarding the labor question it was mentioned that many negroes were employed in the trade, especially in the South. The negroes were also advancing North. They were now to be found in shops in Philadelphia, Baltimore, Cincinnati and elsewhere. They were finding employment as laborers and casting cleaners.

The circular inviting other foundrymen's associations to combine with their own organization had been directed to all interested parties at present known to the secretary and Special Committee. It seems that the Western Association of Foundrymen were under the impression that this was a local affair, and included only Philadelphia foundrymen, and it was necessary that the impression should be corrected. The Special Committee having the distribution of the circular in hand reported progress, and the intimation was made that the circular was favorably received by the recently formed Western Association. It was submitted that it would be in order for this association to send a communication to the new association at Chicago, congratulating its members on its formation and expressing the wish of this association to be in touch with them upon all matters, and offering them any information at present in its possession.

The treasurer reported the balance on hand June 1, $389.91, and all bills paid.

The McLaggan Foundry Company of New Haven, Conn., the F. M. Davis Iron Works Company of Denver, Col., the C. S. Swallow Company of Trenton, N. J., the Crown Smelting Company of Chester, Pa., and R. S. Newbold & Son of Norristown, Pa., were elected to membership in the association.

E. H Mumford of the Henry R. Worthington Foundry, Elizabethport, N. J., then made some remarks at length on the subject of

"Keep's Test for Cast Iron,"

pamphlets descriptive of the test having been distributed prior to the commencement of the meeting.

He said in introducing the subject of a new system of tests, he wished to state very plainly that neither he nor the company he represented had any interest in the system, other than the common interest he trusted they all felt in the bringing to the notice of their association anything novel that had been found to be of use to foundrymen. He might say, inasmuch as Mr. Keep had been kind enough to couple his name with his in the pamphlet then before the meeting, that in Detroit some years ago, Mr. Keep and himself were neighbors—that is, the foundry with which he was at that time connected and Mr. Keep's place of business were not far apart, and, having occasion to make a test for certain castings, he investigated Mr. Keep's method, and, becoming interested in it, had resolved that if ever he were so placed as to be dependent upon a system of tests he would know where to get a good one.

No longer ago than last July I experienced the need of some such guide in the management of our cupolas, and wrote to Mr. Keep, with the result that I secured from him the first set, I believed, of any apparatus sent out. The apparatus described in the pamphlet is more complete than the apparatus I am using, and, I believe, more complete than is recommended for foundry use. In fact, it is a question whether foundries are ready to adopt so elaborate a system as Mr. Keep proposes. While the pamphlet describes the test very completely, with the method of making it, it may be well for me to say a few words regarding it. 1, As to what the demand for any good foundry system of tests may be; 2, what the nature of such a test is; and 3, what results can be obtained from such a system. As to the demand for some kind of foundry tests, however crude, I think there is plenty of evidence that methods, ofttimes crude, for testing the strength of cast iron, are used. A bar clamped in a vise, and having a weight hung on the end, is considered good enough by many people, and there are many methods for making tests of shrinkage. I doubt whether the use Mr. Keep puts the chill test to has ever been followed for ascertaining the degree of hardness in castings.

The other day I had a call from a leading chemist who wished to give me an idea how useful chemistry was to the foundry, and, incidentally, how useful he, as a chemist, could make himself to our foundry. The chemist assured me of his belief that the system of tests I am using (Keep's) was very good, but too complicated for everyday use, and that it began at the wrong end. As a chemist, he said, he thought he could regulate the product of a foundry absolutely, and mentioned that, after the product of the cupola had been cast it would be too late to apply a remedy. This statement I was bold enough to deny, as I do not believe I can always predict an absolute result from the analysis. I am using chemistry as a sort of hygiene, and am supplementing it with Keep's test as a means of obtaining a diagnosis of symptoms with good results. The chemist may prescribe a diet, so to speak, but without a method for obtaining physical tests to indicate the results forthcoming castings may turn out hard and crack, and the trouble not be discovered until the castings had reached the machine shops some weeks after, and too late for remedy. The chemist in this case may be able to suggest a remedy, or, at any rate, explain the trouble. But unless the chemist has some means of making a physical test he has to work entirely in the dark.

For nearly a year it has been my practice to make tests almost daily by the Keep process, and to carefully record such tests in order to keep mixtures uniform, and at the same time keeping constant watch of the daily changes in the results. The time consumed in this way does not exceed three hours a week. If the iron appears to be going wrong, or getting hard, or shrinking too much, I know immediately what remedy to apply, thanks to the chemist; at this point chemistry counts. The main guide in the mixture for the cupola, as all know, seems to be the silicon, and if too much shrinkage is apparent it is evident that more silicon is required.

On the occasion of a visit to a roundhouse in England I found a practice in vogue of placing a sign on the boiler head denoting that the boiler was empty. I asked the foreman whether he found it a good plan, and it was admitted there was just a chance of a hostler at some time finding no sign there and putting in a rousing fire without any water, with disastrous results. The safest is always to try the gauge cocks. So it is with Keep's test. If there is implicit faith in the competency of the chemist to control the foundry output, men will place iron in the cupola, neglecting even rough inspection, and will eventually—it may be weeks later—find everything wrong. But if there are systematic physical tests made it will be found within a day that something is wrong, and there will be time to correct it. I cannot say much as to the nature of Mr. Keep's test that is not explained in the admirable little pamphlet before the meeting, but I, and doubtless all present, find it absolutely necessary to use some system of tests, and I feel that Keep's is superior to any that I know.

I consider it necessary that a man moling test bars should be kept at the work constantly, that the same kind of sand may be used, that the man may "keep his hand in," and that the ladle may be always in the same condition. Keep's test is unusually delicate in its indications, on account of the small size of the bars used.

This fact is illustrated in a letter I have just received from Mr. Keep regarding the effect of the condition of the ladle from which he pours his test bars. Chemistry will avail very little to show what effect a green ladle has on a casting, and I doubt whether a large test bar would show the same differences in iron poured from different ladles. Mr. Keep says that the results are startling. His bars were cast in three sets. One set from a green ladle, newly lined and baked over night; another from a ladle used the day before and cold; a third from a ladle in use for an hour, and therefore both dry and hot. From the green ladle his shrinkage on the ½ inch square bar 12 inches long was 0.155 inch, and the strength 369; from the ladle used the day before, and cold, the shrinkage was 0.151 inch, and the strength 386; while from the ladle that was hot, the shrinkage was 0.143 inch, and the strength 335. From my own experience I can quote a case of a casting which, although shown by Keep's test to be not up to the usual standard, yet passed satisfactorily. It was a cylinder casting. Keep's test, which ordinarily gives me from 0.155 to 0.159 inch in the square bars, jumped to 0.185 inch, and the chill obtained by splitting the end of the square bar, as noticed in the bar before the meeting, the chill occurring from the contact of the hot iron with the polished face of the chill, which ordinarily runs about 0.05 inch, jumped to 0.29 inch, or ¼ inch, and the strength, which is generally over 400, dropped down to 352. The results were so startling to me that I did not believe the casting to be good for its purpose. Yet, although it was found hard to bore out, it finally passed inspection.

Here is seen the usefulness of the test. Had there been anything in our regular mixture wrong, as appeared in this singular instance, it could have been at once corrected. The difficulty in this instance lay in the introduction of brass scrap by accident, the analysis of the iron showing copper 0.02 per cent., and there must have been also a good deal of spelter and tin.

The results to be obtained from this method of test, or any other careful method, are more to be looked for in making it possible to keep iron uniform and make a certainty of its being kept so than to bring about startling developments. While the strength of the test bar which is included in Keep's system is interesting, it is not as important as the shrinkage and chill tests. I believe that most designers make strength a very secondary question. At the same time the investigation of shrinkage leading to cracks in castings is very important.

I believe that it is the absolute routine and accuracy of the Keep test that make it of service and that the shrinkage and chill tests are far more valuable than the tests of strength. I have here a diagram of one of Keep's tests. A bar $\frac{1}{2}$ inch square not only stood a test of 500 pounds, but held it while I stepped to head of machine, and afterward endured a second application. The diagram shows very nicely what the characteristics of the bar are. It is a photograph of the iron itself.

Referring again to Mr. Keep's letter and the tests of the ladles, Mr. Mumford stated that the results as quoted by him should not be taken as final or correct, as they were were not yet fully verified. Mr. Keep had stated that the iron was caught from a cupola in one ladle and divided among the smaller ladles in 15 pound parts. He (the speaker) once made a mistake, or rather his molder did, by dipping his ladle for the test bars from the top of a large ladle, which made a great difference in the iron. As far as chemistry was concerned, the question was, whether it would overcome any variation in shrinkage made on the same day from the same cupola. Asked which test, chemistry or Keep's, he would use, supposing one test only could be made or adopted, he said he would use Keep's. Having Keep's test and knowing no chemistry, it would be quite possible to return to "No. 1 Scotch" and correct any bad results from the use of higher numbered brands, and this is what the practical founders would do at the sacrifice of cheaper iron, which it is the aim of men using Keep's test as well as men using chemistry in the foundry to render available. Keep's test was to point out the difficulty. Chemistry could only explain why the difficulty existed. Finding the difficulty, in his opinion chemistry should suggest the means of remedy.

The chairman remarked as to the question of the strength of cast iron, that it was a secondary question. The irons of to-day were so near to a standard, and the factor of safety used by engineers was so great, that the question the foundrymen had to consider was the procuring of an iron that would work easily, shrink uniformly, would not warp, would have no chilled surfaces, be homogeneous and free from flaws. This was the principal question nowadays. The question of strength was admitted to be there, of course, and in some cases a very high standard of iron was required. The main feature was to determine whether a brand of iron bought was of the necessary quality. Was it free from chill? In casting, would it crack before it was cold or after? In a simple way, at his company's works, they got at the quality by making a test piece 12 inches long, 3 inches wide, $\frac{1}{2}$ inch thick at one end, and feather edge at the other. In casting they could see marked differences. The feather edge showed the chill, and the foundryman drilled holes until he could not penetrate the iron. In the next heat he would find the chill deeper, or shallower, and the length of bar would give the amount of shrinkage. It was a very simple method. Some test pieces showed the chill from feather edge running up 4 to 5 inches where the iron was $\frac{3}{16}$ to $\frac{1}{4}$ inch, while in other pieces the chill would run only a short way. The test piece also indicated the fluidity of the iron. Of course the question of strength in these tests was lost sight of. The chairman then, in behalf of the association, thanked Mr. Mumford for his address.

The secretary then introduced to the meeting H. S. Sparr of Philadelphia, the general agent of the Greiner Economical Cupola Company, who read an interesting description of the Greiner process, as found in the pamphlet of the company, also extracts from an article which had appeared in the Franklin Institute *Journal*, entitled: "An Investigation of the Construction of Various Kinds of Cupolas for Melting Pig Iron." Supplementing his reading with remarks of his own, Mr. Sparr aroused considerable interest. Some discussion took place upon the subject, during which Mr. Rankin of the Abram Cox Stove Company of Philadelphia stated that the Greiner process was in use at his company's foundry, and that so far as they were concerned, it was no doubt worth all that it cost them. It had proved a saving to them, but not so much as had been represented to them that evening, by a good deal. They could melt more rapidly than before, and saved some fuel. He believed, however, that the process would be applied in a more efficient manner than adopted in their cupola. There was some fault in its application which would be remedied the next time the cupola was lined. He could recommend the cupola to any one melting from 15 tons upward, and believed it would prove a saving to them of from 8 to 12 per cent.

The secretary called attention to the fact that about last September he wrote a letter to the Assistant Secretary of State at Washington, asking a number of questions. He wished, for purposes of the association, to get information as to cupola practice in England, France and Germany, and requested the Secretary of State to get the information through his consuls. The Secretary of State accordingly sent out printed letters to each of the consuls of those countries, asking the questions contained in the letter, but up to the present time the association had received no definite answers to the questions. He again wrote quite recently, and received a reply to the effect that about 25 communications had been received, but publication of same could not be made until after July 1. He intimated that if all the questions were answered, the association would certainly get some valuable information which would enable them to draw comparisons regarding cupola and foundry practices in Europe and America.

The expediency of arranging a union or centralization of the associations of foundrymen at present existing or under formation was then discussed by the meeting, the prevailing opinion being that it would be better for the Foundymen's Association to continue on its own lines for the present. The chairman was of the opinion that as the different organizations became more complete a convention would probably result; and therefore it would be well to let things rest and watch the development of the associations throughout the country. The meeting then adjourned to the roof garden of the club, where the usual quarterly lunch was served.

After the lunch, P. D. Wanner of the Mellert Foundry & Machine Company, Reading, Pa., was asked to make a few remarks upon trade at the present time, and, although the hour was late, Mr. Wanner delivered an address which was listened to with marked interest. In the course of his address, speaking of the cast-iron pipe trade, which he more particularly represented, he said that all the foundries, as far as he could learn, were very busy. The demand for cast-iron pipe for this season, and for the year prospectively, would go away beyond any demand that the country had ever seen heretofore. The demand for cast-iron pipe at the present time was, in his opinion, very great, and for the year it would be simply enormous. He believed he made the statement at a previous meeting that the pipe trade was dependent to a great extent upon the weather, and that the droughts experienced during last year were likely to stimulate the pipe trade. The country had had freshets off and on since 1886, and the freshets this year were very bad. The trouble in many sections was not in the getting of water, but in the getting away from it. This, of course, kept the pipe business back. But the droughts of last year all through the country stimulated the trade to a wonderful degree. Almost every town and available village was at this time being piped and yet in the face of all this, in spite of this enormous demand, the pipe was being supplied at very low prices, unprofitably low, in view of the fact, too, that during the depression of the last four or five years the pipe foundries had run down to a great extent. Repairs were in order and necessary, so that even if a gain was made on the poor pig-iron men, that was all that was made, as far as the cast-iron pipe trade was concerned. Whatever profit there was in the business at this time was simply taken from the pig-iron men. When foundrymen came to make repairs during the year, which they had to do at its close, they would probably be just as poor as in the beginning. Under the existing condition of things he had not much hope for the pig iron trade. They would remember that he made some predictions during the early part of the year, and some then present probably thought he was wild when he made them, but in his opinion the predictions had been more than verified, and many around him who had heard him make them could now substantiate them. They could only hope that there would be a change and the change could not come any too soon for all. There might be other causes, but in his opinion the present state of things was brought about by overproduction. In the pipe trade, the pig iron trade, the steel-rail trade and a great many other lines the same cause of depression was apparent. Mr. Wanner closed his address with some forcible remarks on protection and the silver question.

The next meeting of the association will be held July 5.

THE LETTER BOX.

Leaky Gutters.

From B. L. B., *Rockport, Ill.*—In answer to the inquiry of "H. and J." in *The Metal Worker* of May 27, would say that I am satisfied that the tin in the gutter was broken by expansion and contraction, which is considerable in some climates. I have had trouble of a similar kind here and have overcome it by making a shade for the gutter. I nailed short piece of 1 x 3 battens across the top of box, about four feet apart, and nailed to these supports boards of sufficient width to cover the gutter, taking care not to let the board touch the roof, so as to interfere with the flow of water, which in a heavy shower might cause the roof to leak. The board should not be wide enough to project over the boxing, for if so the water would drip from the boards outside the gutter.

Condensation Under Tin Roof.

From C. D. S., *Carrollton, Ky.*—There is in this place a building used for steaming and drying tobacco, with which we have had much trouble, from the condensation of moisture under the tin roof. The ceiling joists are ceiled with ⅞-inch pine boards, tongued and grooved. The room below this ceiling is used for drying tobacco, and has a temperature of 120°. This makes the garret so hot that the moisture condenses on the roof and runs down through the ceiling on to the floor below. There are ventilators in the roof, and a fan running to draw the hot air out of the garret, yet the condensation continues. We had thought of covering the under side of roof joist with some kind of roofing, which would carry the condensed moisture into troughs placed for the purpose, to which would be connected pipes leading out of the building. What scheme can be suggested for overcoming the difficulty?

Answer.—The escape of heat from the drying room to garret could be prevented to a great extent by filling the spaces between ceiling joists with mineral wool. If this did not have the desired effect, the joist under tin roof could be covered with building paper, and then with matched flooring, so as to prevent the moisture from coming in contact with the tin roof.

Overflow from Cesspool.

From S. & H., *Watsontown, Pa.*—Please tell us, through *The Metal Worker*, the best way to dispose of a cesspool which is now full. The pool is dug about 15 feet deep, the top surface for five feet being sand, and the balance through limestone, clay and rock, lined with brick. The sand appears to be cemented with grease, so that it does not waste away. Are there chemicals that can be put in that will eat their way through and form a channel, or must it be abandoned and a new one dug?

Note.—We gather from what our correspondents write that heretofore they had depended on the liquid in the cesspool leeching through the soil so as to prevent the cesspool from filling completely. Now, it appears, however, that the grease in the waste has made an impervious coating and the cesspool is filled up. Of course, our correspondents are aware that the solid matter gradually accumulates and the cesspool needs a periodical cleaning by means of buckets or pumps. To get rid of the waste water there are various plans that are made use of. One is to run a drain from near the top of the cesspool, some distance away, and discharge on the surface of the ground, at a lower level, the waste water being taken care of in that way. Another plan is to run a trench filled with broken stone, or an open-joint tile drain, from near the top of the cesspool into another pit, at a lower level, filled with broken stone and so arranged that the water alone will reach it and filter out into the ground around it. If other blind drains are run from this second pit, it will increase its efficiency and enable it to take care of more water. In either of these schemes or any other similar ones, however, it must be borne in mind that it is necessary to run the waste at or near the surface of the ground, so that the air can get at it and exercise a purifying effect. It is also necessary to remember that the waste will sometimes travel long distances underground, either in the crevices of rock or against the hard surface of a clay stratum, and in that way reach and pollute distant wells and water sources.

Moistening Furnace Air.

From I. D. A., *Flint, Mich.*—The query on "Moisture in Hot Air," from "J. H. C.," in *The Metal Worker* some time ago suggested to me that the experience of one of my customers might be interesting to some of your readers. The house was heated by a furnace and when the weather was coldest, so that it had to be fired extra hard to heat the air enough to make an agreeable temperature in the house, a disagreeable dryness was experienced on some days but not on others. What was the cause of this? was the question asked me and which I was unable to answer. It was found that the dryness always occurred on days when one of the ladies of the house was absent or specially occupied. By careful investigation in watching every incident it was found that when home and not busy, she, being fond of flowers, always visited the conservatory and arranged flowers according to her special fancy in large open dishes and placed them in several rooms, sometimes on the mantel or on a small table and always near the register. As the dishes were shallow, it was noted that it was necessary to replenish the water when the furnace was running hard. The evaporation of the water from the flower dishes was accepted as an agreeable solution of the problem. The furnace had a water pan, but on questioning the servants it was learned that, though a pipe running to it with a faucet made it easy to keep it filled, they did not use it because they thought the water wasted the heat by cooling off the furnace. Instructions were given to keep the water pan full, but, as it often got so near empty that the sediment caused a very disagreeable odor, some other arrangement was sought. Now, a clear glass globe, similar in shape to a camp kettle, is tastily suspended near each register, and, filled with water, gratifies every demand. It has a great advantage in being in sight, so that its emptiness will be noticed, while no dirt will, naturally, be tolerated.

Heating Room from Range Boiler.

From J. H., *Williamsport, Pa.*—Can you or any of the readers of *The Metal Worker* inform me whether a hot-water boiler attached to a range and set upstairs in a bathroom will keep the room at such a temperature as to prevent water from freezing during zero weather? How near must the boiler be to the stove and how far can it be removed from the stove and still circulate? Also, can a boiler stand near the stove and the pipes run up to the bathroom and connect to a radiator? Will this plan keep the room warm, and what size radiator will it take to heat a room 8 x 8 in size or thereabout, the room being on the outside of the house?

Answer.—The quantity of hot-water surface necessary to heat a room 8 x 8 feet, situated "on the outside of the house" (by which we infer that our correspondent means having one side exposed to outside temperature) and 10 feet high is 25 square feet, more or less, according to the character of the building, whether very substantially built or not. About 18 to 20 square feet will suffice to keep it warm enough to prevent danger of freezing, and a good-sized range boiler would have very nearly or quite this amount of surface. Its use would, however, compel the maintaining of fire night and day in the range. Such a boiler may be made to work well if properly connected with the water back when placed one or two stories above the range. With such a position the pipes connecting the boiler with the water back in the range ought to be 1 inch to insure good circulation. Pipes may also run from the boiler when placed near the range and supply a hot-water radiator in the bathroom. The work in either case ought to be done by a skillful man, however, one who can take into consideration all the local conditions and provide for them as they may require. We do not know that any definite limit of distance at which water may be made to circulate through a water back and the boiler of a range has ever been estab-

lished, if such a practical limit exists. If sufficiently large pipes are used for connections, it seems from general principles that circulation might be secured at a considerable distance provided a proper inclination of the pipes could be obtained. The radiation from the pipes cooling the water tends to retard the circulation, but the limit of distance to which the water would flow before becoming absolutely cold would not likely be reached in such domestic apparatus.

Core Box Plane.

From R. A. F., *New London, Conn.*—Having saved myself much labor and executed work that was correct to a hair's breadth with my core box plane, I send this description, with sketches of it, so that others may be benefited by its use. All planes of this kind that I have ever seen were made and not square, but slanting, so the point on the side when set will come in the point of the angle of the plane. The mortise in the plane, to receive the cutter and the wedge, should be so located that the cutter will cut all on one side and so that the point of the cutter will always come right to the point of the angle of the plane. From this description and the illustration I think no difficulty will be found in making the tool.

To make a core box with it, having trued up the material, take a marking gauge and lay out, in the middle of the wood, a space as wide as the diameter of the core you wish, as shown in Fig. 2, the dotted lines showing the semicircle desired, or if a taper core is wanted lay off the diameter at each end and draw the lines from one end to the other. Sink these lines in deep enough to allow a chisel to cut a gutter to start the plane on each side, as shown in Fig. 3. Now, with a gouge rough out the material in the center, as in Fig. 4, and start in with the plane. As the cutter

CORE BOX PLANE.

by the owners, and I have never heard of any being for sale at any tool dealer's. For making an accurate box and doing it quickly for round cores for foundry use, whether they be straight or taper, it will be hard to beat this plan. A box for making round cores is generally made in two parts, each part being hollowed out to a half circle its entire length, and the hollowing out of this space by a gauge and sand paper, using a templet to test its trueness, is a tedious task for a very careful workman. With a core box plane as illustrated in Fig. 1 an ordinary workman can make a true core box in a few minutes. It works on the principle that no angle but a right angle can rest its point on any part of the arc of a semicircle and at the same time touch both ends of the arc. The construction of the plane is simple and any one needing such a tool can readily make it. Take two pieces of hard wood 1 inch thick, 6 inches wide and 8 inches long; fasten them securely together to form a perfect right angle or square. On the inside fasten another piece of wood, 1 inch square, for strength and to give more material where the cutter comes through. The cutter need not be over $\frac{1}{4}$-inch wide, sharpened only on the end like a chisel does most of its work on the point and is narrow, the gouge may have to be used again as the work progresses. By holding the plane so that the blind side of it presses against the side of the gutter, as it is pushed forward it will cut toward the center of the semicircle it forms, as it cuts down, as shown in Fig. 5. After cutting out one half it will be necessary to reverse the material and begin again on the other side. The other half of the core box is made in the same way and if the plane is sharp and only a very thin shaving cut each time it will require very little sandpapering to smooth it up ready to receive the pins when the core box is completed.

Soldering Galvanized-Iron Trough.

From H. B., *Lebanon, Mo.*—What is the proper way of soldering an old galvanized ogee hanging gutter that is broken at the seams? The gutter is on a building 40 feet high, and the owners do not wish the trough taken down. As the seams in gutter next to building are perpendicular they are difficult to solder in new work, let alone in old. Is there any kind of flux better to use for soldering than muriatic acid?

Answer.—As the trough is a hanging one, and at such a distance from the ground as to make it difficult to work at when in position, we would suggest that it be taken down in long sections and the joints well riveted, which would have a tendency to prevent their breaking apart in the future. They could then be soldered, for which purpose it is probable muriatic acid would be the most convenient flux to use, as when of sufficient strength it would render scraping of the joints unnecessary. The ends of sections, which would require to be soldered when the trough was in position on building, should be well tinned, which would render the operation of soldering much easier. If it is necessary to solder the broken joints when the trough is in position on the building, it is a question if there is a more convenient flux to use than the acid above-mentioned. When soldering with acid the coppers can be cleaned by dipping in a solution of sal-ammoniac.

Torrance Wood Furnace.

From M. M. B., *St. Paul, Minn.*—Will some reader of the Letter Box kindly give me the name of the makers of the Torrance Double Cast-Iron Drum Wood Furnace?

The new Krag-Jorgensen magazine rifle, adopted for the army, is to be made at the Springfield Armory, and the cartridges for it at the Frankfort Arsenal. It is probable that enough of the special machinery needed will be in place in time to begin manufacturing about July 1.

A crisis seems to have been reached in the affairs of the Reading Railroad Company, unless the bond and stock holders assent to the readjustment plan.

PLUMBING and GAS FITTING.

Eleventh Annual Convention of the National Association of Master Plumbers.

The annual convention of the National Association of Master Plumbers met in Milwaukee, Wis., this week. The Executive Committee of the association held a preliminary meeting on Monday afternoon at the Hotel Pfister, arranging various matters of detail in connection with the deliberations of the convention. The members of the committee present were: President, Jeremiah Sheehan of St. Louis; vice-president, Daniel G. Finnerty of Boston; recording secretary, O. J. Gerhard of St. Louis; treasurer, W. E. Goodman of Milwaukee; Robert Griffith of Chicago, T. J. Radcliffe of Brooklyn, Henry G. Gabay of New York, C. T. Paul of Los Angeles, F. E. Hopper of Cincinnati and D. F. Sullivan of Dallas, Texas.

TUESDAY MORNING.

On Tuesday morning the members of the numerous delegations assembled at the Hotel Pfister, formed in procession and marched to Lincoln Hall, led by Clauder's band. There were 306 in the ranks, a larger number than at any previous convention.

Arriving at the hall, an address of welcome was delivered by F. W. Pripps, president of the Milwaukee Association of Master Plumbers, who outlined the programme of entertainment provided by the local craft and by the Rundle-Spence Mfg. Company of Milwaukee. He was followed by V. W. Deeley, assistant city attorney, who made a formal address of welcome in behalf of the Mayor of Milwaukee, in the course of which he paid a tribute to the high reputation for honest work and moderate charges of the Milwaukee plumbers, who are so well regarded by their fellow citizens that representatives of the craft are honored with political positions. President Jeremiah Sheehan of St. Louis replied in behalf of the association, thanking the citizens of Milwaukee for their cordial greeting. He then proceeded to business by appointing Patrick Ferriter and William Halsey of Milwaukee sergeants-at-arms. A Committee on Credentials was appointed, as follows: Isaac Riley, Boston; John J. Keenan, Brooklyn; Geo. E. Howe, Los Angeles; Wm. Schwehr, Jr., St. Louis; J. J. Wade, Chicago; Geo. E. Sands, Pittsburgh; Wm. Harkness, Philadelphia. The convention then adjourned until 2 o'clock to receive the committee's report.

TUESDAY AFTERNOON.

Tuesday afternoon's session opened with the calling of the roll as made up by the Committee on Credentials. The names of those in attendance are as follows:

Members Present.

Altoona, Pa.

O. L. McCartney. J. F. Delaney.

Baltimore, Md.

John Trainor. Geo. W. Addison.
B. J. Barry. J. F. P. Carey.
P. T. Barry. E. J. Healy, Jr.
Jas. Connoly.

Bay City, Mich.

William Sullivan. Fred. Fischer.

Bloomington, Ill.

Robert Loudon.

Boston and Vicinity

Wm. H. Mitchell. Daniel Shannon.
D. G. Finnerty. P. H. Winn.
David Smith. T. J. Tute.
Isaac Riley. J. S. Boyd.
E. C. Kelly. J. C. Kelly.
James Tucker. T. H. Duggan.
J. W. French. John W. Cosden.
Chas. M. Bromwich.

Bridgeport, Conn.

H. B. Middlebrook. Alfred Hopkins.
Zalmon Goodsell.

Brooklyn, N. Y.

Thos. H. Radcliffe. M. J. Gleason.
Geo. B. Lewis. E. Macdonald.
J. W. Kelly. G. Alfred Smith.
E. Hayward. J. J. Keenan.
Wm. J. Gault. W. F. Buckley.
Jos. Zoll. O. O. Sawkius.
R. J. Knox. Geo. Cummings.
H. M. Noble. John Danaher.
T. A. McWhinney. John H. Read.
Wm. Eiermann. Paul Ayers.
Willis Gardner. Geo. W. Smyth.
Thos. Hudson. Thos. Evans.
Martin Fallon. E. S. Kelly.

Buffalo, N. Y.

C. B Huck. Jacob L. Mensch.
Charles Geiger. A. E. Stevenson.
L. P. Beyer. Louis W. Gay.

Burlington, Iowa.

Henry Ewinger.

Chicago, Ill.

Daniel Rock. C. J. Herbert.
A. W. Murray. D. Whiteford.
J. J. Wade. T. C. Boyd.
J. F. Dalton. C. C. Breyer.
Thomas Conway. P. Redeiske.

A question arose in connection with the Louisville delegation as to whether a State vice-president should be recognized as a delegate in addition to the number to which a local association is entitled, at the rate of one for every ten members or a fraction thereof. A decided difference of opinion was expressed in interpreting the provisions of the constitution on this subject, but the preponderance of sentiment waa manifestly in favor of the admission of the vice-presidents with the same atanding as regularly elected delegates. The formal settlement of the matter was postponed until after the completion of the calling of the roll, when President Sheehan decided that State vice-presidents had all the privileges of delegates. He also decided that the local associations that had elected a State vice president as one of their delegates were entitled to name another delegate.

Mr. Hannan moved that a committee be appointed to draft resolutions on the deaths of Enoch Remick of Philadelphia, N. B. Hussey of Omaha and M. J. Lyons of Brooklyn, occurring during the past year. The president appointed Messrs. Hannan of Washington, Griffith of Chicago, Lewis of Brooklyn, Evanson of Philadelphia and O'Neill of Lincoln, Neb.

An Auditing Committee was then appointed consisting of Messrs. Culloton of Chicago, Firmin of San Francisco and Kuhns of St. Louis.

The Boston Association presented a resolution reciting that "any manufacturer of or dealer in plumbers' supplies furnishing net prices or any discount from list prices to others than master plumbers, either by themselves, employees or agents, shall be considered as violating the Baltimore resolutions." It was referred to the committee on resolutions.

Chairman Sands of Pittsburgh next read the report of the Sanitary Committee, as follows:

Report of Sanitary Committee.

Your committee, in presenting their report, feel their inability to do justice to this question. But in looking over the reports of health officers from various parts of the country, for the past year, we, as master plumbers, should have every reason to be encouraged with the decreased death rate in the cities where they have enforced plumbing regulations, and, we trust, practical plumbers as inspectors.

While we all feel like congratulating ourselves on what we, as master plumbers, have contributed to this end, there still remains much to be done; work in which every master plumber could be a missionary in the education of the people to the dangers that beset their lives, and the lives of their children, in the matter of imperfect and unsanitary plumbing, and to show them the necessity of prompt action in removing the cause. In warning the people of such danger, we do not mean that it should be done in a mercenary or selfish way; but because we feel, as honorable men, that it is a duty we owe to our fellow men.

While we may never expect, notwithstanding the regular annual report of a decrease in the death and disease rate, to arrive at that state of perfection that we can dispense with the services of the physician and the undertaker, or the sanitary plumber, yet by a little effort on the part of each and every master plumber, we can contribute much toward bettering the sanitary condition of every city and home in the land.

A Committee on Resolutions was appointed as follows: Messrs. Mitchell of Boston, Duffy of Louisville, Hayward of Brooklyn, Trainor of Baltimore, and Tierney of Providence, R. I.

In the absence of reports from officers, Mr. Wade of Chicago brought up the question of iron pipe versus clay pipe for the interior of buildings, and invited a discussion of the subject, but it was not followed up.

The convention then adjourned to meet in executive session on Wednesday morning.

WEDNESDAY MORNING.

The session of Wednesday morning, although intended to be an executive session solely, waa enlivened by an address of welcome from Governor Peck of Wisconsin, who had not been able to attend the previous day. His remarks were liberally punctuated with applause by the delegates. He assured them that he regarded the work of the plumber of far greater importance to the health of a community than any service that could be rendered by any other profession. Referring to the arrangements for entertaining delegates, he trusted that every one would be so well treated that he would go away convinced that there was but one State —Wisconsin—and but one city in that State—Milwaukee. He discussed the perennially interesting subject of plumbers' charges, stating that a man would cheerfully pay a thousand dollars for a fine plumbing job on a new house and kick afterwards on a bill of three dollars for repair work, alleging that it had only taken five minutes' work by a boy. Therefore he recommended, to avoid all kicks, that plumbers do repair work for nothing. The plumbers cheered him to the echo, and then proceeded to active work in executive session.

Immediately after the close of Wednesday morning's session the members marched to the Exposition Building and were photographed in groups.

WEDNESDAY AFTERNOON.

(By Telegraph.)

The afternoon session proceeded to business with open doors. Financial Secretary Tute read his report, showing receipts for the year of $4915.70, which had been paid to the treasurer. Reso-

lutions were then introduced by several members and referred.

The report of the Executive Committee was read, reviewing the work of the past year and making suggestions on which they desired action by the convention. The president appointed Messrs. McCoach of Philadelphia, Weldon of Pittsburgh and Young of New York a committee to consider the suggestions and report on them.

Chairman Hannan then reported on an admirable preamble and series of resolutions on the departed members during the past year, and which was adopted by a rising vote. Chairman Murray presented the report of the Committee on Essays, giving a list of topics on which essays had been invited. The list was most excellent, being very comprehensive and covering many practical subjects. The committee had received a number of very interesting papers, which would be read to the convention at the earliest opportunity. The president's report was next read.

Following is the principal part of the very able report made by President Jeremiah Sheehan.

President's Report.

I think it would be expedient at the close of our eleventh year to pause for a moment to note our progress and how well we have accomplished the objects of our organization. As enumerated in our constitution, we are organized for sanitary, commercial and social purposes. I know of no association that has, in so short a time, advanced as rapidly as we have. We all note with pride the improvement made in sanatory appliances and the high class of workmanship to-day. In formulating wise sanatory laws and causing their enactment and enforcement we have raised our vocation from mere mechanics of old to professional men, holding the health of the nation in our hands. We all look with pride at New York's State law for the registration of plumbers and the supervision of plumbing and drainage. In our commercial interests we have made equally as important advancement. We all know the kind of competition we had to contend with before the organization of the National Association, but to-day we have an almost perfect protection against the unscrupulous practices confronting us at our birth, which caused us then to be rated as extortionists. To-day our better class of architects give the preference to men doing the best work, thus inspiring us to do good work and eradicating the fallacy that keen competition demands shoddy work. You will remember when manufacturers and jobbers jeered at our efforts of self-preservation, but to-day they recognize our motives as honorable and just, and treat your officers with that respect and consideration due the representatives of an organization like ours. Only a few months ago a Western jobbing house thought the National Association of Master Plumbers not worth noticing. In fact, our communications were not worthy of a reply, but in an incredibly short space of time this same party suddenly came to the conclusion that the National Association were after all really worth noticing, and very quickly and gladly amended its former method of business to conform to a more approved method. Fellow craftsmen, let us remain firm in unity and harmony and we hold our destiny in our own hands.

I regret to note that in several instances parties, after becoming members of the National Association, have supposed the association to be created for their individual needs, and have endeavored to use their membership to keep other practical and worthy plumbers out of the association, and by thus endeavoring to deprive them of membership have sought to prevent them securing plumbing supplies under the Baltimore resolutions, and have themselves written to the supply houses, causing your executive officer much trouble. This idea is entirely wrong. The National Association extends a hand of fellowship to all worthy master plumbers legitimately engaged in the business, or so desiring to engage, and says: "Come join with us; we can benefit you and want your aid in carrying on the work inaugurated." I do not by this mean to recommend the admission of every applicant, regardless of his ability as a plumber. This association is organized by and for master plumbers, and none but such should be admitted to our councils. The St. Louis Association has adopted a new constitution making it a necessary requisite for membership that a candidate must have served five years' apprenticeship and three years a journeyman plumber. This qualification for membership may be a little advanced for some localities, but I believe that the line ought to be drawn between practical and impractical men. Where laws are in force, as in New York State, a certificate from the Examining Board ought to be necessary for membership.

STATE ASSOCIATIONS.

I am pleased to note the extension of the "State association idea" during the year in Massachusetts, Rhode Island, Washington and Northern Wisconsin. I would recommend State associations, more especially in States where associations are small and master plumbers scattered throughout the State, sometimes but one or two in a place. Through a State organization all these can be brought together in one compact association, and, as a whole, better act on all matters appertaining to their welfare, enabling them to secure much better results than could otherwise be obtained by a number of small associations—all after the same results, but not united in their efforts. The Texas, Kansas and Iowa State associations are examples of what associated effort can achieve toward the protection and elevation of the craft throughout the State. The New York State Association has been more than paid for the trouble and expense attendant upon the formation of its association by the passage of its State plumbing law.

One of the duties of a State vice-president is to assist in organization of associations in his State. Therefore, permit me to suggest to the delegations here to be more careful in the selection of State vice-presidents, as the office is a very important one. We are but young in years, and in this vast domain there are many localities where the objects of the National Association and its influence are unknown. We want reliable and active gentlemen who are willing to devote a little of their time to organization and looking after the interests of those already in affiliation. I have mentioned the excellent results obtained in several of the States, and I am sure that the gentlemen who have been instrumental in bringing about these results will be more than repaid for their work by the improved condition of the trade in their respective States.

I would earnestly urge State associations and local associations of a State to work as a unit in formulating sanitary laws and using their combined influence in securing their passage and providing for their successful enforcement. The enactment and enforcement of wise laws will make it impossible for unscrupulous and incompetent men to bring discredit upon our profession, and as a result the public would be insured against poor work and the plumber protected against unskilled competition.

Through the energetic efforts of your vice-president and his Massachusetts colleagues a State plumbing law for Massachusetts has been passed.

State Vice-President of New Hampshire Robert J. Donnelly has been actively endeavoring to secure the passage of a State plumbing law, and it is believed his efforts will be crowned with success. A number of other associations have been following out this same line of work and have met with more or less success.

LOCAL ASSOCIATIONS.

During the year there have been 21 associations organized, representing 269 master plumbers, in the following places:

San Diego, Cal.	Detroit, Mich.
Pasadena, Cal.	Grand Rapids, Mich.
Oakland, Cal.	Escanaba, Mich.
Redlands, Cal.	Mt. Clemens, Mich.
Stockton, Cal.	Kalamazoo, Mich.
Sacramento, Cal.	Saginaw, Mich.
Atlanta, Ga.	Tacoma, Wash.
Savannah, Ga.	Spokane, Wash.
Roanoke, Va.	Shreveport, La.
Peoria, Ill.	M. P. A. of North
Joliet, Ill.	Shore, Ill.
San Francisco (re-affiliated).	Northwestern M. P. A. Wis.

Twenty-one master plumbers have affiliated with the National Association as individual members.

The following State associations have been organized during the year: Michigan, Massachusetts, Rhode Island and Washington.

We have fourteen State associations, as follows:

Colorado,	Connecticut,
Iowa,	Massachusetts,
Kansas,	Michigan,
New York,	Montana,
New Hampshire,	Ohio,
Texas,	Rhode Island,
Washington,	Illinois.

Increase in membership in old local associations	250
Increase in membership in new associations	269
Total increase in membership	519

Since we last assembled the Angel of Death has taken from our number three of our honored members who had the welfare of the association at heart and gave freely of their time and money toward its advancement.

On July 25, 1892, the sad news was received of the demise of M. J. Lyons of Brooklyn, who for five years was the custodian of the finances of the National Association. May 9, 1893, marked the departure of N. B. Hussey of Omaha, who served on the Executive Committee with ex-president Robert Griffith. Only last month the sad news was received of the demise of Enoch Remick of Philadelphia, who died on May 24. Mr. Remick was elected our first financial secretary and held the office for seven consecutive years.

I am most happy to be able to turn over to my successor the affairs of the National Association in, I believe, a better condition than ever before existed. Not a single complaint, that I am aware of, is on file.

I bespeak for my successor the same hearty support that has been accorded me during my 19 months of office.

In conclusion I extend thanks to my fellow-craftsmen and co-laborers for the efficient manner in which they have so materially advanced the interests of the National Association by their support; especially to the Executive Committee, who have eased the burden of responsibility by their unanimous support; to the State vice-presidents, who have encouraged me by the active interest manifested in their duties; and to the trade press, the molders of public opinion, for their support during the year.

Treasurer Goodman submitted his report for the year ending June 14, stating that there was a balance on hand last year of $1305.60, and receipts during this year of $4915.70, making a total of $6221.30, from which had been paid $3187.10, leaving a balance now on hand of $3034.20.

Chairman Mitchell of the Committee on Resolutions reported, recommending adoption of a resolution introduced by the Boston delegation.

Resolutions were then introduced as follows:

Whereas, The potters of the United States are using different sized threads upon their water closets, thus causing much delay and annoyance in event of repairs being necessary; therefore, be it

Resolved, That the National Association recommend that a uniform thread be adopted for such connection, to be that of standard 1¼, 1½ and 2 inch gas-pipe gauge in every respect.

The next resolution, by the Boston delegation, was as follows:

Whereas, It has become the general practice of architects to specify the plumbing fixtures required in buildings by the solicitation of manufacturers or their agents and

Whereas, It is also customary to require the contracting plumbers to warrant goods for one year or more; and

Whereas, Many of said fixtures after being put in use proved to have been defective through unforeseen imperfections,

Resolved, That it is the sense of this convention that architects who specify a cer-

tain line of plumbing specialties shall secure a guarantee from the manufacturer or his agent that such goods are as represented and that any unforeseen defects shall be made good at the expense of the manufacturer and not of the plumber.

These resolutions were approved by the Committee on Resolutions and were adopted by the convention.

A. W. Murray of Chicago then read his paper on sanitation, which is printed in another column.

Secretary Gerhard read the essay submitted by the Milwaukee Association, entitled "Education of the Craft," the joint production of Messrs. Pripps and Plum.

Chairman McCoach next presented report on State vice-president's reports from Massachusetts and Indiana. The reference in the Massachusetts report to Vice-president Finnerty was unwarranted, and the complaint in the Indiana report with regard to changing the place of meeting of the eleventh convention was uncalled for, as the Executive Committee had power to change the place of meeting should they deem it desirable. The convention approved this report. Mr. Hayward of Brooklyn then read a paper on the benefits to be derived from master plumbers' associations.

Resolution by J. J. Wade of Chicago was also favorably reported, that the National Association exert their powerful influence toward the abolition of the prevailing custom among master plumbers of supplying labor or materials on buildings on which another plumber is engaged, either as contractor or day worker, without first consulting the latter and obtaining his permission; when such permission is obtained the successor in such work will refuse to furnish labor or materials until his predecessor has received payment and satisfactory compensation for the work performed.

The committee also recommended the adoption of resolution introduced by Mr. Wade to do away with the use of clay piping for drainage purposes inside of buildings, and recommend the exclusive use of extra-heavy cast-iron pipe, and that even then every pipe so used shall have received thorough test at the factory and be marked tested for house-drainage work.

The resolution introduced by Boyd & Culloton of Chicago also recommended that front page of report of national proceedings in the future be reserved for the names and addresses of past presidents. The convention approved all the recommendations.

Reports of State vice-presidents were then read for Pennsylvania, Ohio, California, Rhode Island, Kansas, Connecticut, Missouri, District of Columbia, Michigan, Wisconsin, Kentucky, Illinois, New Hampshire, Maryland and Texas, after which the Auditing Committee reported the officers' accounts correct. The meeting then adjourned till Thursday morning.

We print below several reports from the State vice-presidents:

District of Columbia.

BY JAMES NOLAN.

As State vice-president of the District of Columbia I beg leave to submit the following report:

The growth of the local association since the close of the last year has been steadily increasing. We had last year a membership of 33; we have now on our rolls 40, an increase of seven for the year. The attendance at meetings has been good. We make our meetings as interesting as possible by discussing different practical questions that arise in our business, and, by this means, endeavor to make improvements on old methods and thus reach the highest sanitary standard. Our meetings are always very pleasant and interesting to members, and we hope in our next annual report that the membership will be much larger than at the present time.

The dealers here have, to some extent, conformed with the Baltimore resolutions, but there are a few outside dealers and manufacturers selling to parties not in the trade. Names and particulars will be submitted in executive session. After a long struggle, and with the assistance of the National Executive Committee, we have had new plumbing regulations enacted by Congress, which were adopted February 15, 1893, by the Commissioners of the District of Columbia, a copy of which was forwarded to your Executive Committee. These regulations are now being strictly enforced by competent inspectors, and we thereby hope to elevate our business to a much higher standard, and we trust we will be able to stop the "snides." We have had no strikes, nor do we expect any. Our association, by unanimous vote, decided to give the journeymen working for them eight hours a day from June 1, 1893, with the same pay, without having received any request from them.

Work is steadily improving this season; we had a good fall and winter work, and the prospects of the future, under the capital new regulations, are very bright.

Rhode Island.

BY PATRICK TIERNAY.

As the heart of the unhappy son, who has been absent for many years from the fold of his father's family, leaps with joy when upon his return he is received with open arms, so feel the hearts of Rhode Island sons, as upon their return, after years of absence, united and determined to uphold that mighty bulwark of protection, the National Association of the United States, you have received them with joy and happiness.

It is not my intention to present to your minds the unhappy experiences which your brothers of Rhode Island have encountered, but rather my most pleasant duty to direct your minds to a most happy condition of things in our little State. We have three of the four cities in the State strongly organized, each having its local association. These are Providence, Pawtucket and Woonsocket. Words from me cannot express the united, whole souled and brotherly feeling now existing in these three associations.

We have strong expectation of organizing next year a good local association in the city of Newport.

We have a uniform retail price-list, one of which accompanies this report, which hangs in the office of each master plumber, and which, I am pleased to say, is being followed to the letter.

Our feelings and relationship with the three jobbing houses, it is gratifying to be able to say, are of the most harmonious kind, we having their signatures to an agreement embodying the spirit of the Baltimore resolutions. Signs are displayed in their stores such as "No goods at retail," "Goods sold to master plumbers only." They all have signified their willingness and desire to help build up and elevate the plumbing business to that position of honor which shall be second to no other business in the building trades of this country.

We also have a State association, whose protecting influence is second only to the National Association.

To the vice-president and financial secretary of the National Association, Daniel G. Finnerty and Thomas J. Tute, and the following members of the Boston Association: James F. Devlin, David Smith, Isaac Riely, Daniel Shannon, J. W. French, M. J. Keane, J. C. Kelly, Dennis Hargan and J. R. Tully, we feel greatly indebted for their assistance, rendered on several occasions, the first being on March 30, when Mr. Finnerty called a meeting of the master plumbers of the State together at Narragansett Hotel. Although our Providence Association had healed up little differences of opinion, and reorganization on March 10 has strongly cemented the members together in our local association, still the above meeting indirectly resulted in the organization of our State Association, and at which the presence of the same gentlemen was strongly felt.

I take this opportunity, on behalf of our local and State associations, of thanking our Boston brethren for their assistance; and we do not forget also that our Worcester friends rendered valuable assistance by their presence at the formation of our State Association.

In conclusion, I feel warranted in promising for the next year, from Rhode Island, a true spirit of fidelity to the National Association, and good work from our local and State associations.

Maryland.

BY WM. H. ROTHROCK.

As vice-president for the State of Maryland, it is my pleasant duty to report that our association is in a prosperous condition and has a bright prospect for the future.

Through the united efforts of members, we anticipate a large augmentation in the near future to our membership, owing to the conservative and beneficial arrangements we are about closing with our local dealers.

We were cognizant that illegitimate sales were being made by some indifferent dealers, who sold indiscriminately and in conflict with our interests. Happily, we are effecting an agreement with all the houses, and expect to enjoy the benefits accruing from our efforts shortly, and believe the arrangement we are entering into will not only stimulate our membership, but will save the vexatious friction and wrangle that invariably result from the existence of such circumstances.

New Hampshire.

ROBT. J. DONNELLY.

I take pleasure in submitting my annual report for the State of New Hampshire for the past year. Within the last year considerable has been accomplished by our association, through the efforts of our members and the assistance of the different Boards of Health. New rules and regulations have been submitted by our State association, and I am pleased to say have been adopted by some of our largest cities. The rules and regulations, so far, have been of immense advantage in improving the standard of work and elevating the trade, and we hope before another year they will be adopted by every city and town in our State. There has been no interruption of business from strikes or labor troubles, and everything now is working harmoniously.

We have added eight new members to our association during the past year. The number of master plumbers in the State association, at the present time, is 19. We have some good material now in the association, and promise well for the future.

Our relations with the manufacturers and dealers in plumbing supplies, with one exception, are satisfactory, and this slight grievance we hope to overcome very soon.

I am sorry to say that the essay submitted to our State association by the National Committee was received after our last meeting in April, and, consequently, we were unable to do anything with it. The subject was of too much importance to write up in a hurry.

In conclusion, I wish to thank the officers of this association for their friendly feeling and kind assistance rendered me in the performance of my duty.

Connecticut.

BY S. E. DIBBLE.

As vice-president for the State of Connecticut I respectfully submit my report for the year ending June, 1893:

The local associations throughout the State are in a flourishing condition. They are mostly confined to the larger cities in the State, though efforts are being made to induce the plumbers in the smaller cities and towns to form associations in their several localities. In the furtherance of this object I have recently prepared a letter to be sent to every worthy master plumber in our State who is not already a member of the State association, and I trust that it will have the effect of creating a wider interest in our State organization, and thereby materially increase our membership. This letter briefly calls attention

to the objects which the association has in view, and the privileges which its members enjoy. I confidently expect that much good will come from its distribution.

As near as I can ascertain, I am led to believe that the manufacturers and wholesale dealers in plumbing materials are holding strictly to the spirit of the Baltimore resolutions, and it is the desire of our State association to make them feel that it is for their interest to continue so to do.

The last annual convention of the State association was held in the city of New Britain on February 9, 1893. It was a very pleasant and agreeable feature of that convention to find so large a number of new applications. Questions of considerable importance were brought up and discussed and referred to the Executive Board of the association to consider and report.

The convention elected the following officers—viz.: President, S. E. Dibble, New Haven; first vice-president, James Ahern, Hartford; second vice-president, J. B. Wetant, New Britain; recording and corresponding secretary, A. J. Clerkin, New Haven; financial secretary, R. H. Stothart, Middletown; C. S. Eames, Bridgeport.

The next convention is to be held in Hartford The cordial manner in which the members of the convention were met by their fellow members in New Britain, deserves special mention.

As in New Haven, where, largely through the efforts of the local association, a new set of ordinances for the better regulation of the sanitary condition of the city has been passed by the city government, so in New Britain, guided by the inspiration of the recent convention and largely through the efforts of the State association and the local association there, much is being done toward the improvement of the sanitary laws of that city, which, I am informed, are incomplete and defective.

The executive officers of the State association are rendering much assistance in carrying on the good work throughout the State, and in educating the members of the trade to a better understanding of its work, and in advancing the cause of sanitary improvement. And I would here take the liberty of expressing to them my thanks for their help and my appreciation of their kindly consideration, and I would also extend to the officers of the National Association my grateful acknowledgment for the aid which they have at all times given me in the performance of my official duty.

I append a copy of a letter which it is proposed to send to every master plumber in the State who is not already a member of the State association.

(Copy of letter).

NEW HAVEN, CONN., June 1, 1893.

DEAR SIR.—The Connecticut State Association of Master Plumbers was organized in 1891 with these objects in view, viz.: To advance and enforce sanitary laws; to protect the public health; to promote the intelligence and influence of the master plumbers of the State in matters relating to their trade; to protect them against the encroachments upon their rights and interests in the purchase of supplies; to cultivate mutual good feeling among themselves and confidence in each other.

These objects, to a large degree, have been secured. To extend these privileges to all the master plumbers of the State, is the purpose of this letter.

As every good citizen should help to support the government that protects his life and property, so should every good master plumber help to support the organization that protects his business interests. The State Association of Master Plumbers is doing this to-day, therefore, why should not you, master plumber, become a member of the State association by applying to its Executive Board, and upon the payment of $2 per annum you will be entitled to all its benefits.

The National Association of Master Plumbers was organized in 1883, and is protecting and advancing the interests of its members throughout the United States.

Will you kindly give this your earnest consideration and bear in mind the fact that in becoming a member of the local and State association you not only benefit yourself, but also your family, your business and the public at large.

Nebraska.

BY JAMES H. O'NEIL.

It is with the highest feeling of personal gratification and the keenest appreciation of the good things of life that I am privileged to be present at this meeting and partake of the "food for thought and action" resulting from the practical experience of our wide-awake, intelligent master plumbers.

To me these conventions have been seasons of great profit, and I would that the same inspiration to increased zeal and unfaltering intrepidity along the lines discussed here which comes to me through this medium might fall upon my co-workers in the fair State of Nebraska; then I should not have to undergo the deep sense of wounded pride and humiliation which is forced upon me by the presentation of this unfavorable report.

For the legitimate master plumbers in Nebraska, the past year has been a very discouraging one, inasmuch as a condition of things is in existence which seems to set at naught the higher ideals which exist in the true master's mind. Lincoln—and I can also safely include Omaha and many other minor points in the State—has been for the past year, and still continues to be, a rich field for the "pirates" and incompetent ones who assist the alleged jobbing houses and cheap manufacturers to dispose of their goods direct to the consumer. During the last three years I have come in personal contact with at least six of this class of people—it would be an indignity to the name to call them master plumbers—who grew tired and quit under the enormous weight of profits derived from contracts taken of $400, $600 or $1000 jobs for $200, $300 or $500, and many more just such calculators throughout the West, especially in my own city, are now in the same dilemma. Perhaps this is too plainly spoken, but why varnish or conceal the true facts as they are found, when it is impossible to calculate the disastrous effects upon the legitimate business?

When a man can engage in some enterprise entirely foreign to the plumbing trade this year, and next year come out a full-fledged "consulting sanitary engineer," competing with those who have grown gray in the business, what are we to expect or hope for? And yet, in the face of all this, many of the most able fellow masters of Nebraska rest upon their oars, or dream at their post, instead of uniting their brain and their brawn with that of this National Association in their untiring efforts to crush the insidious foe. "Where there is unity, there is strength," could never be more appropriately applied than to the work in which we engage; and until we are one in aim, in effort, and in design, we shall ever be weak. As I can frankly say from my own experience, individual effort alone availeth but little. I have prayed and begged the master plumbers of Nebraska to join the National Association, but with what unflattering success I deplore to mention. I have sent solicitous communications hither and yon—all over the State—which in but few instances have won replies. Could they but partake of the incomparable benefits to be derived from this source, they would no longer withhold their effort and encouragement.

Should any crisis be evolved resulting from a strike or the cutting off of all purchasing power of the legitimate master plumber by these alleged jobbing houses who sell direct to the "pirate" and consumer, methinks these now indifferent masters will then hasten to seek the protection of this National Association and the Baltimore resolutions. Without the prophetic vision of the seer, I can see the little cloud in the distance, although now no larger than a man's hand, which may, ere long, burst over our heads, engulfing us in dismay and ruin.

In conclusion, gentlemen, permit me to freely and frankly express the hope that this association may name some other man to represent the master plumbers of the great and grand State of Nebraska for the ensuing year—some one possessed of the ability to imbue my fellow-masters with a greater degree of fraternity and a more concentrated effort in action. Most respectfully submitted, JAMES H. O'NEIL.

Kentucky.

BY THOS. P. WATTS.

In making my report as State vice-president for Kentucky I beg leave to say that the past year has been one of extreme quietude, pleasure, and, I hope, profitable to the fraternity in our well beloved State. I am sorry to state that the State is not blessed with many very large towns and cities, and, therefore, not very many water companies and plumbers.

However, I have written a number of letters to the various plumbers throughout the State, and urged them to join the National Association. To one of the larger towns I made a personal visit, and hoped to accomplish some good results, but they did not all get together while I was there, and afterward let the matter drop, failing to see the wonderful benefits arising from local associations.

As to the Louisville Association, I will say that it is enjoying unqualified success, as it numbers every master plumber in the city who is desirable; and in the matter of protection, we have the utmost protection awarded us by the supply houses, being only sorry that this report is not of a character to encourage the National Association by the addition of membership.

I will close by saying, "Long live the National Association of Master Plumbers."

THURSDAY MORNING.

(*By Telegraph.*)

Thursday morning's session was opened by the reading of a communication from the Milwaukee Builders and Traders' Exchange tendering the use of their rooms to the Association, which was received with thanks.

Report of the State vice-president of Indiana was then read. The writer was evidently not pleased with the manner in which affairs in his State had been going, and dwelt at some length on differences of opinion among the local members, winding up with a complaint regarding the selection of cities for the annual convention. The report was heard with expressions of disapproval from members and it was referred to the Committee on Reports of Officers for such disposition as they deemed advisable.

The report for Washington was next read, after which Chairman McCoach handed in the report of his committee on the recommendations of the Executive Committee.

The recommendation for local conference between master plumbers' local associations and journeyman plumbers' associations was reported favorably and approved by the convention. The suggestion of the Pittsburgh delegation that the basis of representation in the national convention be changed from one for every ten members to one for every 20 members was reported unfavorably by the Executive Committee and was also unfavorably reported by the special committee, and their action was indorsed by formal vote of the convention.

The question of representation in the national convention then came up through the favorable report on the recommendation of the Executive Committee, that three members at large should be elected by State associations to represent scattered members in a State not connected with local associations. An animated discussion was precipitated, in which Messrs. Trainor, Hayward, Gabay, Dewstoe, Tobin, Hannan, Wade, Boyd, Mitchell, Firmin and Murray participated.

The Rossman amendments to the constitution submitted last year, changing representation in the National Associ-

ation to representation through State associations alone, were offered as a substitute for the committee's recommendation. The substitute, however, was defeated by a very heavy vote, and the committee's report was approved.

The recommendation of the Executive Committee to consolidate the offices of financial and recording secretary was reported unfavorably by the special committee, but the convention, after some discussion, refused to accept their views, and approved the recommendation of the Executive Committee.

The report of the State vice-president for Massachusetts was then read. Exceptions were taken by Massachusetts delegates to some of the statements made, and the report was referred to special committee for consideration.

THURSDAY AFTERNOON.

Thursday afternoon's proceedings began with an executive session, after which the doors were thrown open. The Committee on Resolutions reported unfavorably on the resolutions offered for the consideration of the convention as a part of Alex. W. Murray's paper on sanitation, and the report was adopted.

A communication was then read from the Master Steam and Hot-Water Fitters' Association of the United States on the subject of consolidation with the National Association of Master Plumbers, as follows :

We would recommend that the Executive Committees of the two associations confer together with regard to matters affecting the two associations and be governed by the combined action of this joint committee, the same as each association would be by their own Executive Committee, but we do not recommend the amalgamation of the two associations any further than this. The two trades are so distinct and so separate that the steam contractors would have very little interest in the reports on sanitary questions, and the plumbers would have very little interest in the reports on heating and ventilating, so that instead of being a benefit it would be a detriment to both associations to have any closer connection than the above. We recommend that a committee of three be appointed to wait upon the National Plumbers' Association next week and report to them our action taken in this matter, and that said committee report to the incoming Executive Committee the action taken by the National Plumbers' Association.

(Signed)

EDWARD GRASSLER, Milwaukee.

D. M. QUAY, Chicago.

WM. P. THOMPSON, Philadelphia.

Committee of Master Steam Fitters' Association.

The communication was referred to the Executive Committee.

The convention then took a short recess, after which they proceeded to the election of officers for the ensuing year. The only name presented for the position of president was that of Daniel G. Finnerty of Boston, who was accordingly declared elected unanimously amid great applause.

The honor of the vice-presidency was not won so easily, as the following candidates were named: Thos. H. Radcliffe of Brooklyn; J. J. Wade, Chicago; John Mitchell, New York; Zalmon Goodsell, Bridgeport, Conn.; Philip H. Murphy, Milwaukee; John L. Firmin, San Francisco. Mr. Murphy withdrew his name with thanks. The chairman appointed Messrs. Mitchell of Boston, Trainor of Baltimore and Hannan of Washington tellers. They announced 223 votes cast, of which Radcliffe received 96, Mitchell 66, Wade 60 and Goodsell 11. There being no choice, Mr. Goodsell's name was withdrawn and a second ballot was ordered, with no choice; the third ballot was also without result. The fourth ballot being ineffective, the Chicago delegation withdrew the name of J. J. Wade, leaving the contest between Messrs. Mitchell and Radcliffe. The former received 98 and the latter 95 votes. Mr. Mitchell was, therefore, declared elected, and acknowledged the honor in a most excellent speech.

W. E. Goodman of Milwaukee was elected treasurer unanimously to serve for a third term.

President-elect Finnerty announced that he had selected David Smith of Boston for financial and recording secretary, and the convention ratified his choice.

The selection of a city for the place of meeting next year was then taken up, and the attractions of Philadelphia, Brooklyn, Detroit and San Francisco were eloquently portrayed by their respective representatives. The vote was taken by ballot, and Detroit won by an overwhelming majority. The date will be fixed hereafter. The respective State delegations handed in the following names as their choice for State vice-presidents.

STATE VICE-PRESIDENTS.

Ohio, David Miller, Cincinnati.
Wisconsin, Ferd. Wittig, Milwaukee.
Minnesota, Allen Black, Duluth.
Maryland, Jas. F. P. Carey, Baltimore.
Nebraska, Jas. H. O'Neill, Lincoln.
Indiana, Geo. F. Kirkoff, Indianapolis.
Connecticut, Jas. Ahern, Hartford.
Illinois, Wm. T. Geary, Chicago.
Iowa, Henry Ewinger, Burlington.
Kansas, Jas. Foley, Leavenworth.
Michigan, Fred. Shriver, Sr., Grand Rapids.
Missouri, J. M. Life, St. Louis.
Massachusetts, John C. Deedy, Worcester.
Texas, F. J. Madden, Sherman.
Kentucky, Thos. P. Watts, Louisville.
New York, Wm. Tobin, Syracuse.
Pennsylvania, J. L. McShane, Pittsburgh.

The president was then authorized by the convention to appoint vice-presidents for other States represented in the National Association, but which have made no choice of a vice-president, including two for California, one for the Northern and the other for the Southern part of the State

John L. Firmin of San Francisco then presented President Sheehan with a magnificent badge as a testimonial of the regard in which he is held by his fellow-members of the association. Mr. Furmin's speech was worthy of the occasion and was suitably responded to by President Sheehan. The badge is of solid gold decorated with diamonds and having the initials of the association on the pin bar.

The essays remaining unread were ordered to be printed in the proceedings. D. F. Sullivan of Texas moved that a committee of three be appointed to prepare a suitable emblem for presentation to each of the past presidents, but the convention voted in the negative.

The new Executive Committee was announced as follows:

Daniel Finnerty, Boston.
John Mitchell, New York.
W. E. Goodman, Milwaukee.
David Smith, Boston.
Jeremiah Sheehan, St. Louis.
Thos. H. Radcliffe, Brooklyn.
J. J. Wade, Chicago.
H. G. Gabay, New York.
James G. Weldon, Pittsburgh.
M. J. Duffy, Louisville.

The convention adjourned, *sine die* after the usual resolutions of thanks to the local committee and the press.

The National Association.

At a social review of trade history
Was born the union of the like mind;
"They builded better than they knew:"
With hopes known to but a few,
They would labor for all mankind;
In this pledge lay their glory.

'Midst penury and pestilence they strove
To realize their noble aim;
To elevate and protect their trade
From poachers and unjust tirade
Upon skillful labor, and little gain,
Though great the obstacles, yet they throve.

Upheld thro' all their struggles, hopes and fears
By vision of victory to come—
Despite knavish ridicule and blame
And slander of a purpose to defame:
Theirs the reward of work well done,
As the praise of craftsmen greet their ears.

A rallying cry was then heard
From the East to the West;
Soon from the South the same came forth,
To be echoed in the far off North:
Then hope filled their breast,
And grateful were the prayers offered.

And this day in debate assembled
We meet, our work and counsel to review.
Strong in the faith and defense of right,
To protect the home from miasma's blight;
Enthused with courage, brothers new,
And praise those to be remembered.

Let over us a voice proclaim:
"Be earnest, just and true;
Let your lamps forever burn
The wiles of foes to discern;
To fraternal laws the pledge renew,
And yours the reward of well-earn[ed]
fame."

"ORPHAN BOY"

Syphonings.

— THIS CONVENTION will undoubtedly be known as the biggest on record, over 300 delegates having shown their interest in the welfare of the association and all sections having been well represented.

— THE NEW FACES at this gathering made the old regular as much of a stranger as though it was his first appearance, but as water seeks its level, so good fellowship finds affinity with equal rapidity and all reserve melts in the warmth of the greetings.

— THE PACIFIC COAST was well represented, Executive Committeeman C. T. Faul heading the delegation from Los Angeles, with E. L. Burgoin and wife, L. A. Scholes and wife, John Crimmins and Geo. E. Howe.

— SAN FRANCISCO sent representatives for the first time, John L. Firmin and T. J. Ford of Ford Bros. showing a reflection of the Golden Gate in the sunny smiles that beamed on every new acquaintance.

— THAT the knight of the pot and ladle is gallant is not to be controverted; the number of ladies present and the courteous attention they received clearly showing that a gentle heart guides his great right arm.

— THE MILWAUKEE PLUMBERS have a strong local association. There are only five firms in the city not actively connected with the organization. The good results of the association are keenly appreciated by the members, who have not lost hope that in time they will be able to gather in those who still linger outside the fold.

— PRESIDENT SHEEHAN was as popular after he became an "ex" as he was when clothed in the full powers of the office he graced. Although not a big fellow, his true greatness is shown in the achievements of his administration.

— E. L. BURGOIN, manager of the plumbing goods house of L. M. Perry & Co. of Los Angeles, was there and everybody was glad of it. He seemed to know everybody and helped everybody else to enjoy the same pleasure.

— JAMES RAGAN seemed to have a fatherly care over the Washington delegation, who will take in the World's Fair before returning to aid Grover in keeping the country in a sound hygienic condition.

— C. F. GESSERT of 42 Dey street, New York, left radiators and all heating and ventilating talk at home and greeted his many old friends at the convention in the best of humor. He will make a flying visit to the World's Fair before he returns.

— C. F. WIELAND, General Manager, Bignall & Keeler Mfg. Company, St. Louis, was in town on a business trip relative to their pipe threading and cutting machines, but talked as interestingly to the plumbers as if lead pipe was the only kind of pipe in existence.

— LINCOLN HALL was decorated with flowers, potted plants, festoons of evergreens and flags, while above the stage a large banner with "Welcome Master Plumbers" on it greeted the visitors as they entered.

— THE BADGES were, as usual, a characteristic of the convention, Connecticut having the most unique, a red ribbon with gilt letters and a silver-plated pin to which are attached a solder pot and a wooden nutmeg. Philadelphia had a dark-blue button of large size with the lettering in gold. New York had a blue ribbon and a gilt pin. Boston had a dark-blue ribbon, to which was attached a pure gold plumbers' tool bag. Chicago had a ribbon of the accepted terra-cotta color with the typical triangular division in silver with a Columbian medallion attached to a g . . . pin (gilt, good or gold, as the reader prefers). The other delegations had equally appropriate badges, but they so dazzled our eyes and were in such number that we couldn't remember them.

— MAJOR FOSTER of Norfolk, Va., is the father of the association, having been its first chairman. He became free and a full-fledged "jour." in 1846. He is well known, and enjoys telling a good story, many of which he has accumulated in his pilgrimages to the different conventions.

— DENGEL & DIGSBY, a local plumbing house on Grand avenue, had their windows trimmed with flags in honor of the association, and other association shops had made it a point to make a fine display in their show windows.

— J. D. STILES stopped at the Pfister House, and Jenkins Bros.' valves were not by any means the only theme of his conversation. Mr Stiles and Mr. Jenkins rendered a grateful service to the steam fitters in Chicago in entertaining the overflow from the tally-ho coaches while they secured another and arrived in time for both the photo and the banquet.

— R. D. REED of the H. B. Smith Company of Westfield, Mass., was on hand to greet the cold-water fitters, and with his handsome presence probably left a yearning in the hearts of the susceptible to try steam and hot-water fitting as a means of heating and ventilation.

— THE EASTERN DELEGATES to the convention traveled to Milwaukee over the Baltimore & Ohio route, occupying eight Pullman cars. On the way a car lamp fell, igniting the dress of Mrs. Lewis, wife of a Brooklyn delegate, but she fortunately escaped serious injury. This was the only accident.

— THE CALIFORNIA DELEGATION had more to talk about with regard to their trip than any of the other travelers. They came near drowning in Missouri, traversing a flooded district, where they saw houses floating off their foundations.

— N. C. BUTTERFIELD was glad the convention was in Milwaukee; so was his wife, as his home was there, and the Boynton Furnace Company had an exhibit in his charge. Their hard coal hot-water apparatus was shown by a No. 23, and the soft coal hot-water goods by a No. 104, while for smaller work they showed a No. 18 Niagara.

— THE APPLE of the convention was A. (J.) Sweeting, from Auburn, N. Y., who represented the Roll Paper Cutter Company of Richford, N. Y., and displayed Hilt's adjustable chain pipe wrench. No trouble is experienced in making it take hold of a pipe, as the lever screws down on the jaw, pinching the pipe firmly. Wisconsin is a fruit State, but it takes a high tree to top this Sweeting, who stands 6 feet 3 inches.

— THE CONNECTICUT DELEGATION was 11 strong, under the charge of Major Middlebrook, who is one of the oldest men in the profession. After the convention they proceeded to Chicago, where they had secured an entire house and will do the fair at their luxurious ease.

— A PLUMBER with a ruling disposition is Zalmon Goodsell, ex-Mayor of Bridgeport, Conn., also president of the local plumbers' exchange, of an athletic association and of the Springfield Emery Wheel Company, nevertheless he follows the lead of Major Middlebrook.

— A LARGE OIL PAINTING ornamented the walls of Lincoln Hall showing a kitchen with stove and boiler, with a leak in the supply pipe and the gay and charming plumber holding the cook, while the modest cat jumped out of the window, and a dog and the plumber's kid who was heating the solder looked in. In the center is "Bridgeport, Conn., 1893" and in one corner a poem, as follows:

The Giddy Plumber.

Behold the plumber with smiling look,
Soft soldering the handsome cook.
Her chin he pinches and laughs at will,
For every item is sundries in the bill.
Lightning fitter of water, steam or gas,
He's composed of solder, cheek and brass.

This, we learn, is to be hung in the art gallery at the fair after the convention.

— WHEN the convention took its first recess the joke was on A. W. Murray, secretary of the Chicago Master Plumbers, who had a boutonniere and an overcoat all right, but no hat. He asked everybody, "Where did you get that hat?" until he transferred the joke to the junior Heatherton by espying the lost tile on his curly locks, whence he dislodged it and proved property by extracting his card. Heatherton found a dilapidated substitute, but will not be happy till he gets his own tile.

— BERT LAMBERT, representing the Clayton & Lambert Mfg. Company of Ypsilanti, Mich., does not have to say gasoline fire pot once; the boys all know that the old wood fire for melting solder is a thing of the past, and swear by the gasoline fire pot.

— A GRACEFUL COMPLIMENT it was that President Sheehan paid the press by crediting it in his report with having rendered substantial service in the elevation of the plumber to his present high position.

— THE TITLE of orator of the convention indisputably belongs to Brother Cross of Kansas, whose full, rich tones and correct enunciation made the reports of the State vice-presidents, which he read, seem a series of poems.

— A CARD calling attention to the qualities of the Shea patent removable glass seat ball cock was found in every chair at the convention after dinner on Wednesday. It is made by the Duluth Brass Works of West Duluth, Minn.

— A HANDSOME leather-covered memorandum book was presented to the delegates by the Brooklyn Master Plumbers' Association. The book contained a pocket for papers, a calendar, and portraits in halftone of the officers. It is the official book of the association, and in addition to a list of the officers and ward committees it has a list of the licensed plumbers in Brooklyn revised to date, the completion of the book having been delayed as long as possible to be finished in time for distribution as a souvenir. It also contains a list of the city officials and of the dealers who have signed the Brooklyn agreement, with several pages of advertisements and a suggestion to patronize the dealers who patronized the book.

— BERRY BROS. of Indianapolis, Ind., distributed a neat catalogue of their Simplicity tanks and seats. Special features of the tank, they claim, are that it is noiseless and the valve will not leak, having been tested to a pressure of 250 pounds.

— THE CARD of Geo. L. Bottum of Chicago was the only evidence of shop he brought with him, though from the many warm greetings exchanged both the Lanston Lead Works and the American Plumbers' Supply Company are likely to profit by his visit.

— THE LOYALTY of the plumbers to the National Association and their disposition to avoid even the appearance of a lack of harmony among them, were manifested by a little episode on Tuesday afternoon. After the convention had adjourned, a meeting was called of those interested in the formation of State associations. Wm. H. Mitchell of Boston was elected chairman and C. J. Prescott of Kansas City, secretary. The formation of State associations was advocated in a speech by Wm. Tobin of Syracuse, who gave his views at length, speaking in favor of local associations being made subordinate to State organizations, and the latter to elect delegates to the National Convention. Others followed, when suddenly the idea was suggested that the subject was one to be treated in its proper place, at a session of the convention. This view prevailed overwhelmingly and the meeting quickly adjourned.

— IT WOULD take a troop to properly represent any big house at the biggest convention on record, and E. W. Blatchford & Co. of Chicago, knew it. They sent H. B. Troup to do the honors of the house and if necessary to talk lead pipe and oakum, soil and solder and anything else a plumber might want to know about in a first rate line of plumbers' supplies.

— HENRY EWINGER of Burlington, Iowa, was introduced by Treasurer Goodman as the longest sleeper at the convention, but "Big Henry," as he is familiary known, was always wideawake when the fun commenced.

— MRS. TUTE says she is a plumber, too, and the worthy financial secretary from Boston will always retain the greatest treasure he ever had in his keeping, even when time finds some other worthy plumber in the office he now holds.

— TO SAY THAT NICHOLAS SPANG represented the L. Wolff Mfg. Company of Chicago would cast a reflection on his colleagues, H. E. Whitney and Chas. A. Ford, but that any desired information could be had from either of them about high grade rare sanitary goods was a foregone conclusion.

— AFTER tea Tuesday night an orchestra discoursed rare music from the balcony of the Pfister House, and there was no lead in the heels of the plumber lads as they threaded the mazy dance with the lassies. The music and the example in the balcony were too much for the boys who had long since served their time, and the handsome tile floor of the rotunda was cleared and resounded with the footsteps of the stag-waltzers.

— DURING an interesting discussion at the convention on the first day the ladies entered Lincoln Hall in a body and were greeted with clapping and cheers that disposed of the question promptly, and the disposition that had been felt to adjourn prevailed at once.

— ON ASSEMBLING at the ball for the Tuesday afternoon session a representative of the Keystone Mfg. Company of Buffalo, N. Y., exhibited something entirely new in a combination monkey wrench and ratchet drill, which secured him several orders.

— FREDERICK HOLMES, secretary and treasurer of the Milwaukee Gas Stove Company, exhibited a Perfection gas cooking range and a Perfection water heater, which greatly interested the plumbers. To not a few of them the connecting of the return pipe from the water heater to the top of the boiler was new, but some old hands verified its advantages and many others caught the idea at once, although some still believe the old way best

— A. B. PIERCE, representing the N. O. Nelson Mfg. Company, St. Louis, left shop at home and yet could not help stating that the town of Leclaire, Ill., is almost entirely composed of their workmen, as it is there that they make all of their bathtubs and cabinet goods. At Mound City, Ill., they have their wood pump works. These, with their plant at St. Louis, where they make plumbers', gas and steam fitters' supplies, give them an enormous producing capacity.

— THE JOLLIEST of all the convention meetings was held Tuesday evening in Parlors 6 and 7 of the Pfister House. A card in the rotunda notified all to call on the American Radiator Company. By the way, A. R. C. stands for American Radiator Company, and spells arc, the most brilliant of all electric lights, and, appropriately in this case, the most brilliant of all entertainers. C. K. Foster and S. L. Hopper were aided in dispensing hospitality by the valve man, J. D. Stiles of Jenkins Bros., R. D. Reed of H. B. Smith Company, F. W. Somers of A. A. Griffing Iron Company, W. J. Kelly of the Kelly & Jones Company, and F. W. Herendeen. The star of brightest magnitude was A. E. Hyde of J. B. Clow & Co., who will long be remembered by all the plumbers who called, for his dialect recitations. Every guest was presented with an American Radiator Company catalogue and a handsome souvenir paperweight, and the chunk of lead, or old brass fitting will, in consequence, disappear from many a plumber's desk.

— S. S. BREWER says the plumbers were an appreciative audience when he talked of the "Joy" that was prepared in Titusville Pa., and as a radiator of warming cheer its presence was a joy wherever it had circulation. By the way, he represented the Chicago house of T. C. Joy & Co.

— PRESIDENT MEAD and Secretary Schneider of the Grand Rapids (Mich.) Plumbers' Association had a system of tramping that permitted no good fellow to escape their genial smile.

— THE PRIDE of Eastern plumbers and the grace of the convention was a charming little lady from Boston, the daughter of Financial Secretary Tute, who was the object of much chivalrous devotion from the old war horse from Connecticut, Major Middlebrook.

— JAMES H. O'NEILL from Lincoln, Neb., is an ardent supporter of the association, firmly believing in it as an institution to elevate the craft. He states that the plumber in his town is much annoyed by the jobber selling direct to the consumer, and in consequence the plumber is kept busy figuring on work that he never gets.

— THE MILWAUKEE MASTER PLUMBERS ASSOCIATION presented every delegate with a souvenir of the convention, which had been prepared by F. J. Murphy. It was an elegant volume of some 76 pages, containing the programme of the convention, names of officers, names of the local committees, views of the principal Milwaukee buildings, points of interest about Milwaukee and quite a large number of advertisements apposite to a plumbers' convention. It was handsomely bound in dark brown cloth, with a gilt title.

— JAS. H. CRUMLEY spent one evening in trying to find a Detroit paper to get some home news, but being unsuccessful fell in line with the boys and helped to make things lively.

— BARLOW BROS. COMPANY of Waterbury, Conn., were represented by J. Barlow, who will stop at the Fair, and no exhibit will interest him more than the plumbing in his State building, which they sent some "kids" to do.

— AMONG those who were at the Fitters' Convention at Chicago last week, and at Milwaukee this week, are John A. Wheeler of Wheeler & Pitkin, Kalamazoo; C. C. Dewstoe of Dewstoe & Snyder, Cleveland, Ohio, and many other familiar faces.

— THE STANDARD MFG. COMPANY of Pittsburgh, Pa., was ably represented by George W. Young, who found many old acquaintances and as many new listeners to his descriptions of the superior sanitary goods made by the house.

— JOSEPH GUTZEIT of San Antonio, Texas, discourses enthusiastically on the superior climate of his city, claiming 100° is the highest ever reached, and even then a cool night refreshes the weary plumber.

— DANIEL J. FINNERTY, who has just been elected president, is 45 years old, having been born in Boston, August 12, 1848, of Irish parents who had made America their home twenty years before. He was educated in the Boston public schools, and for one year attended a commercial college. When 15 years old he was apprenticed to James Chambers, one of the best plumbers who ever did business in Boston. During his apprenticeship he was an active member of the Mechanics' Apprentice Library Association. After serving his apprenticeship he worked as a journeyman for several years, and was president of the Journeymen Plumbers' Union. In 1874 he went into business for himself at 25 Charles street, as a master plumber, and in 1888, he opened a branch at 478 Boyleston street, in the famous Back Bay district, where he has one of the finest plumbing shops in the country. His well-known skill and ability have brought him the patronage of some of the oldest and wealthiest citizens of Boston. He has been State vice-president of the National Association of Master Plumbers; also an executive officer and vice president of the association, and has always been an active and earnest worker for the trade's interests.

— ON MONDAY, before leaving for Milwaukee, steps were taken at a meeting of Illinois plumbers, held in the rooms of the Chicago Association, to form a State association. State vice-president Wm. T. Geary assisted in the movement. A temporary organization was effected as follows: President, Robert Loudon, Bloomington; secretary, Joseph Neuerberg, Chicago; treasurer, J. R. Scanlan, Elgin. The Executive Committee consists of the foregoing officers and Messrs. A. W. Murray of Chicago, C. B. Robinson of Park Ridge, and David Whiteford of Chicago. Letters were read from 18 firms expressing their willingness to co-operate in forming a State association.

— THE PLUMBING FIXTURES in the Wisconsin Building at the World's Fair all come from the Rundle-Spence Mfg. Company, as well as the fixtures in the Pfister House, which was plumbed throughout by Spence & Foley, a firm of local plumbers who bought out the old stand where the manufacturing house got its start.

— S. RESEK was just the alloy to mix properly with the plumbers to make the Farnan Brass Works of Cleveland, Ohio, shine out as a fixed star among the purveyors of plumbers' brass goods.

— THE UNITED STATES HEATER COMPANY of Detroit, Mich., find that it is all grist that comes to their mills when they meet the fellows who install steam and hot-water plants.

— THE EXTENT of Milwaukee's hospitality abounded in carriage drives for the ladies. An entertainment of a varied theatrical character on Thursday night at the Exposition building was also thoroughly enjoyed by the plumbers at Milwaukee's expense.

— TREASURER W. E. GOODMAN invited from the platform everybody and their ladies to attend a picnic on Friday at Lake Pewaukee, stating that he would be at the St. Paul station to give everybody a ticket at 7.30 a.m., and emphasized to the many visitors from a distance that it would be Milwaukee local time and that 7.30 did not mean 7.40.

— A PRINCE of good fellows is Edward O. Geran, the hydraulic and sanitary engineer of the Rundle-Spence Mfg. Company, who rendered yeoman service to the Milwaukee boys in spreading welcome amidst the visitors.

— J. B. FRYER displayed the Simplex system of mains for hot-water heating to many interested plumbers, and those who were not there to see it can get full information by addressing him at 1906 Cora place, St. Louis, Mo.

— A. F. BLESCH of the Columbus Closet Company, Columbus, Ohio, and C. H. Mackenheim of the Detroit Sanitary Supply Company, were in attendance, as members of the third house.

— IT IS NOT STRANGE that the boys should want D. G. Finnerty of Boston for the next president, as long as the honors are passed around. He would make a rainy day bright by his presence.

— A WELL-MEANT ATTEMPT was made during the convention to confer a deserved honor upon J. J. Wade of Chicago by making him a life member of the National Association, in recognition of the act of his life in getting up the famous Baltimore resolutions. It was found, however, that under the constitution it was impossible to so reward the esteemed member. The presentation of such a resolution in open convention was in itself a high compliment to Mr. Wade, showing the regard in which he is held.

— ALL of the seats at the convention at one session had a card calling attention to the exhibit of the Boynton Furnace Company at the Pfister House and a catalogue of the Columbian edition of the Milwaukee Gas Stove Company, showing their Perfection line to perfection.

— THOUGH they talk of 25 years as of as many minutes, the fire in their eye and the active interest they took in the entertainment of the plumbers shows that both Rundle and Spence, of the great plumbers' supply house they have built up, are still boys with the boys and broad-gauge men in any company.

—We were handed several leaves of parchment paper secured by a ribbon of "baby blue" on which, in gilt letters, was a monogram R. S. M. Co. On opening we were greeted by a smiling yearling plumber enjoying a buff bath in an old-fashioned tub and learned that a Fête Champêtre to the National Association of Master Plumbers was to be given at Schlitz Park on Wednesday evening by the Rundle-Spence Mfg. Company of Milwaukee. The programme was made up of vocal and instrumental music. The closing pages say "Good night, good! parting is such sweet sorrow that I shall say good night till it be to-morrow." To-morrow "I remember a mass of things, but not distinctly," and in the last page is a picture of a "busted" boiler with the query, "Should auld acquaintance be forgot?" and the unanimous answer was "*never.*"

— J. A. Harris of Sioux City, Iowa, was once an Eastern lad, and his eyes kindle in recollection of the days when he was an active member of the Hook and Ladder Company in Newark, N. J.

Convention Droplets.

Little drops of solder
Melting in a pot
Are not so awful little,
Handled when they're hot.

Little drops of tallow
Dropping from a joint
Are apt to make you hallo!
If they your hand anoint.

Little drops of rosin
Kick up quite a smoke,
If the fire they fall in
From a careless stroke.

Little drops of water
Falling in hot lead
Are apt to treat the plumber
To a jolly spread.

Little drops of wisdom,
Gathered every day,
Make the lad a plumber,
If he's built that way.

Chicago Hospitality as Dispensed by Local Plumbers.

A hearty welcome was accorded the plumber on Monday when he arrived in Chicago on his way to Milwaukee by the Chicago plumbers, and no matter where he hailed from he was cordially invited to their rooms at 197 Madison street. Here he had an opportunity to refresh himself by using their lavatory, and to regale himself with a light lunch from a variety of fruit and some of the liquids which cheer the weary wayfarer that were cooled to an agreeable temperature in a tub of cracked ice.

On the table was a register in which all were invited to leave their autograph. A large blackboard had full information as to the time of trains, how to reach them, where to get tickets and which were the hotels selected. The Chicago delegation went in a body on the five o'clock train with many guests and had a very jolly time.

Their rooms in Chicago are very nicely furnished, many pictures adorning the walls, of which that of Alexander Rafter, a plumber of 1850, is of more than passing interest. Well-filled bookcases of standard works on hydraulics, hygiene and other "byly" scientific subjects afford a fine opportunity for the aspiring sanitary engineer to acquire the necessary knowledge to the profession. Several works of high grade fiction will serve to put a polish on the substantial. In the secretary's room are catalogues of goods from many manufacturers, and no doubt our friend A. W. Murray would be willing to accept all the trade literature that will be sent to his care at 197 Madison street. Among their visitors were many of the gentler sex, and if some girl from a distance should one day find a home in Chicago it would not be strange, and would reflect credit to her taste, for the hospitality sampled is too genuine to be for exhibition purposes only.

Sanitation.*

BY ALEX. W. MURRAY, CHICAGO.

1 Should sanitation be fostered by legislation?
2. Should legislation precede education?
3. The extent of municipal or State authority in sanitary matters.

To properly portray the advancement made in sanitary matters during the progress of civilization, would demand the efforts of a greater mind than that possessed by the writer.

Were the field of literature to be reviewed and analyzed as to its relation to the purity of expressions of thought, or an examination made into the results of calisthenics upon the development of the human frame, or the wonderful truths related that have been discovered in the laboratory of the chemist, as to the purity and adaptation of food products to the sustenance of life, or the attention drawn to the efforts of the disciples of religion to perfect a moral law (consistent with the will of the all-wise Creator), or the debates of legislators upon this theme be repeated while urging the passage of statutes insuring to mankind a perfect hygienic government, with the end in view that the children of poverty would be at least surrounded by that which is essential to their growth to perfect manhood—were a discourse upon these phases of sanitation entered into, it would be overtaxing your patience, and, I judge, not the intention of the Essay Committee in their selection of the subject.

The alchemists of old, in their search for a universal remedy, overlooked the fact that the same was within their grasp, and partook of the nature of giving to the people pure water, pure air and pure food, and also the observance of the moral and natural laws; and instead of a fruitless search for the secret of converting baser metals into gold, had they devoted their talents for the enforced obedience to the fundamental principles of sanitation, they would have been the means of saving to the world human lives, more precious than gold; for the gatherers of health statistics have proved beyond a doubt that millions are lost to the nation which might have been saved by a strict enforcement of the laws of preventative medicine.

In summing up the meaning of the word "Sanita'ion," it means a realization of a condition of a perfect human existence, moral, mental and physical, and which is practically subservient to a sufficiency of pure and wholesome food and water, an atmosphere free from deleterious matter or gases, and a faithful adherence to a moral law harmonizing with nature.

The intelligent reader will observe that the work of the plumber takes a prominent and important part in the drama of life; for it is he who brings to hand the water supply, and when impure provides the filter, or in instances where it is not under sufficient pressure, supplies the sanitary appliances for its procurance, storage and methods for heating it. He caters to the artistic eye in the splendidly equipped lavatory and complete bathroom of to-day, and prevents the pollution of the atmosphere by perfect systems of house drainage and ventilation.

It is evident that the various applications of the plumbing art economize time, and add comfort and enjoyment to human life.

Many of the most approved plumbing apparatus owe their origin to some suggestion or to the inventive genius of members of our profession; so true is this, that in every department of the mechanical field of sanitation some device of the practical plumber may be found.

A truthful history of the progress of the world will prove that wherever the work of the craft is most appreciated there is found the highest grade of civilization.

While the fact is lamentably true that in general conversation and publication the trade is not given the credit that is its due nor in many cases paid what is its due), yet the individual patron does unconsciously murmer peans as to his ability when he consults him as to the merits of this or that plumbing fixture, system of drainage, heating, illuminating or ventilation; but, brothers of the round iron, solder and dresser, we must not stand still, but be marching onward, adding glory to our motto: "Hygiea Excelsior," being always on the alert to improve the fortunes and customs of our trade.

"In the elder days of art,
Builders wrought with greatest care
Each minute and unseen part;
For the Gods see everywhere."

"Let us do our work as well,
Both the unseen and the seen;
Make the house where Gods may dwell,
Beautiful, entire and clean."

Leaving to the medical fraternity the healing of the sick and wounded, the moralist the social problem, the bureaus of health the disposal of garbage, and prevention of adulterations of food, we have now arrived at the question:

SHOULD SANITATION BE FOSTERED BY LEGISLATION?

The correct answer to this question plays an important part in the well being of humanity. The writer answers emphatically, yes; for what other means in this age could be employed for enforcing the sanitary reforms that may from time to time be discovered and developed for the benefit of mankind. Is it to be expected that the parsimonious landlord can be relied upon for the sanitary renovation of his building? Or that the avaricious merchant will let his conscience prevent him from adulterating or counterfeiting goods in order to make an exorbitant profit? Or the medical quack from practicing upon the credulity of the unsophisticated? Or the dishonest contractor from omitting the essentials required by the department of health? Or the penurious manufacturer to make the necessary improvements to insure to his workmen an atmosphere free from dust and contagion? It would, indeed, be trying to the patience of humanity and the sufferer to wait for the much needed reform to come voluntarily from the sordid hearts of such vampires of society. It would need more than the sight of crape and the lamentations of their victims to prick their consciences to a realization of their duties to their fellow man; it requires the strong arm of the law, supported by an intelligent people, to compel their obedience to the principles of sanitation.

Inasmuch as the people at large are benefited by improvements made in sanitary appliances and modes, legislators should foster their introduction by appropriations for the practical demonstration of their utility, and if proved to be beneficial and capable of general adoption, they should legislate accordingly. Sanitation should also be fostered in the following manner: By lending legislative aid for the special instruction of the inspectors who are employed in the various departments of governmental sanitation. Each applicant for such a position should have to pass a rigid, practical and theoretical examination at a high average upon subjects relating to the particular position he desired, the board of examiners to be elected from among the acknowledged experts of the professional and mechanical industries of this particular field. In this branch the Master Plumbers' Association must take a leading part and unceasingly agitate for the necessary reforms. Although having been but comparatively a few years in the plumbing business, the writer is thoroughly convinced that good results from tenement and plumbing inspection can only be attained by having practical plumbers, who have also a good theoretical education, appointed as inspectors. And if this be true from the standpoint of the plumbing, it must follow in the other departments of building inspection. Were this principle faithfully carried out and a rigid accountability demanded of each department of building construction, there would be less victims of falling walls and polluted atmosphere and water.

SHOULD LEGISLATION PRECEDE EDUCATION?

Is the next division of the subject. This could be properly answered either in the affirmative or in the negative. In the affirmative when speaking of mankind in a general way, for it is well known that discoveries and inventions are generally made by single individuals or associations of men combined for mutual benefit; and that it takes years of persistent agitation to educate the public to a proper appreciation

* Prize essay presented by the Chicago Master Plumbers' Association at the Milwaukee Convention of the National Association of Master Plumbers.

of the benefits of an invention or discovery; and arguing from the standpoint that the inhabitants of a village or country town have not, as a rule, the opportunities for general observation as those of the larger cities, nor that one reared in ignorance is as well qualified as the educated to as properly judge of the benefits to be derived from a new innovation, nor that childhood has the discretion of manhood, nor that the insane have the intelligence of the sane. And, furthermore, the average life of man is but of short duration, while wise and beneficent laws remain on the statute book for centuries. Thus, we of to-day have the benefits of wise laws made by our forefathers. Again, presuming that legislators are selected who are men of ability and probity; if an evil custom exists it is their duty to find a remedy and to enact a law for its enforcement.

What a herculean task the department of health would have, were they compelled to educate every person intended to be benefited by the enforcement of health measures. In this view of the subject, it is claimed legislation should precede education. But were the argument to be made in an individual sense—man learns only by experience and research; and in instances where legislators are venal and not of a high order of mental ability, and who proverbially enact class legislation and cannot be induced to act for the general welfare, it becomes necessary to educate the public to the necessity of the reform measures and to the character of their representative—in this light education should precede legislation. And it is incumbent upon all legislators who have not made a special study of a proposed amendment or addition to the laws of the country, to seek advice from men whose experience and study best qualify them to give the required information; for this reason the writer holds that in matters pertaining to legislation upon plumbing the Master Plumbers' Association should be heard before the framing of new laws or mendments to old ones effecting changes in the customs or practices of the trade are made. It is but the right that belongs to them and they should not hesitate to assert it, being a duty they owe to their patrons, themselves and posterity. State vice-presidents and presidents of State associations should be invested with such power and means that they may be able to give the warning when adverse legislation is contemplated, or to aid in the passage of a general State law, affording to the inhabitant of the village the same blessings of sanitation that the citizen of the metropolis enjoys.

THE EXTENT OF MUNICIPAL OR STATE AUTHORITY IN SANITARY MATTERS,

in the opinion of the writer, should be absolute, presuming that the laws have not been enacted in the spirit of class legislation, but in proper accord with the most approved methods known. Human life should not be jeopardized through ignorance or cupidity, without the culprit being as amenable to the laws as he who takes life in malice, frenzy or hatred. It should not be necessary to wait until the fever sign or crape is placed on the door in order to know if a building is in a sanitary condition. Inspection of buildings, new and old, should be compulsory and periodical—say every year—and certificates given as to their condition. It must be apparent to the reader that the time to remedy an evil is to do it before harm is done, and not when one is a sufferer from defective construction.

In localities where the health of the residents is endangered from the miasma of swamps, polluted waterways and unwholesome odors from factories and chemical works, power should be granted the authorities to abate the nuisance. They should have power, as far as practical, to prevent the extension of epidemics, to insist upon the inspection of food products and condemn the same when unwholesome, to close buildings for public assemblage that have not approved methods of ventilation, to inflict fines for the overcrowding of public conveyances, to test the sources of water supply for domestic use, and last, but not least, to arrest all cigarette fiends. Believing it to be your desire to assist in matters relative to sanitation, and that it is the duty of the National Association to do so, the following resolutions are offered:

Whereas, The daily experience of the plumbing fraternity in their labor of repairing defective work affords evidence that protection to the health of the people would be more complete were buildings periodically inspected; therefore,

Be it Resolved, That the Sanitary Committee of the National Association have full power to prepare a proper form of statute covering this phase of sanitation for general adoption, which, accompanied with reasons for the necessity of its passage, shall be printed in a sufficient number to serve the purposes sought to be accomplished, and sent to the State presidents where State associations exist, or the State vice-presidents where there are no State associations; and be it further

Resolved, That it shall be the duty of such State presidents or State vice-presidents to urge the passage of such a law, and that it is the duty of each member and association to lend their influence when called upon; and be it further

Resolved, That the sum of $200 be appropriated for the printing and distribution of such printed matter; and be it further

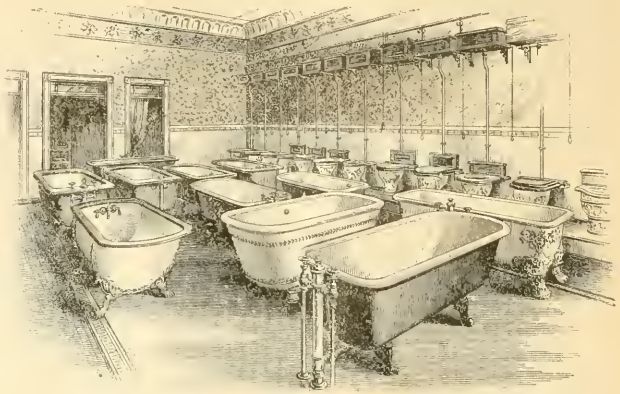
Resolved, That the National Association hereby pledge itself to diligently and with untiring zeal continue to advocate the passage of such legislative measures until they have been adopted in every State in the Union.

ALEX. W. MURRAY.

SEALED PROPOSALS will be received at the office of the Supervising Architect, Washington, D. C., until June 29, for the labor and material required for the plumbing and gas piping in the United States post office building at Ashland, Wis., in accordance with drawings and specifications, copies of which may be had at the office of the Supervising Architect, or at the office of the superintendent, at Ashland, Wis.

Henry McShane Mfg. Co.'s Washington Showrooms.

The Henry McShane Mfg. Company of Baltimore, Md., manufacturers of plumbers' and steam fitters' goods and bell founders, commenced the manufacture of plumbers' goods in 1856, since which time their business has increased to such an extent that they now have branch houses in Boston, New York, Brooklyn and Washington.



The Henry McShane Mfg. Company's Washington Showrooms.—Fig. 1.—Main Room, South Side.

It was not until 1873 that they commenced making church bells. Mr. H. McShane, who for many years had been interested in the sale of church bells, decided to start a bell foundry in connection with his business, and the McShane Bell Foundry thus instituted enjoys to-day a universal reputation.

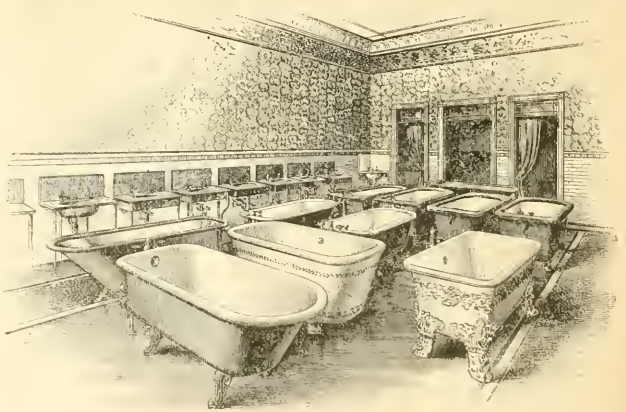


Fig. 2.—Main Room, North Side.

In fact, it is claimed, there is not a country on the globe that does not echo the sound of a McShane bell.

At their New York house they some time ago fitted up a permanent exhibit covering a line of their plumbers' goods, which exhibit has always attracted much attention. This exhibit, however, has been eclipsed by the elegant and costly show room and bathrooms recently completed at their Washington house. The Washington display is contained in their new five-story brick building situated at 423 Tenth street, N. W. The building is a handsome one, with an interior admirably

planned and fitted to meet the requirements of their business. The basement is occupied by machines for cutting and threading iron pipe of all sizes up to and including 8 inches, the machines, as also the elevator, being run by a 12½ horse-power gas engine, in close proximity. The greater part of the first floor is devoted to store purposes, and the remainder in the rear contains the offices. The show rooms are on the second floor front, and the rest of the building is reserved for stock.

The accompanying cuts, Figs. 1 and 2, illustrate the main showroom. As will be seen, the greater part of the floor space is utilized to show a complete line of bathtubs. Conspicuous among them is a large Pompeian porcelain tub, with marble feet, and fitted with the Harvard low-down bell supply combination fixtures. The special feature of these fixtures is the easy latch principle for instantly opening and closing the waste. A prominent position is also awarded to a Madeline porcelain enameled iron bath, with

Fig. 3.—Ivory and Gold Bathroom.

rolled rim, decorated iron feet, and pond lily decorations. This bath is fitted with the Yale combination waste. A number of enameled iron tubs, with rolled and wood rims, fitted with all the modern combinations for supply and waste, are assigned to positions admitting of easy inspection.

Ranged along one side of the room, as shown in Fig. 1, are 14 closets under water supply, and covering a complete line, from the short hopper and trap vent to the finest Ejector syphon closet. The Ejector is a popular closet, controlled exclusively by this company. The closets shown are mostly for open work, in plain, embossed and decorated ware, in the latest designs, and the seats and tanks cover a variety of woods. The water used in the service is supplied from a Hyatt filter, thus insuring perfectly clean water.

On the opposite side of the room, as shown in Fig. 2, are ranged a number of lavatory washstands, in all kinds of marble, some very rare, including Italian, St. Baume, Numidian, Egyptian black and gold, Algerian and Mexican onyx. The washstands are fitted with round, oval, square and recessed basins, and Harvard and Yale fittings. They are all of the open pattern, mounted on brass and nickel-plated legs and brackets in choice designs. The traps used are of the Richmond, Hopkins, Star and Columbus patterns. The room, which is 33 x 24, is richly and handsomely decorated. The walls are finished partly in Lincrusta-Walton and partly in Aniglypta, with a wainscoting of cream tiles, a handsome wall piece in Lincrusta, representative of "Hope," adding materially to the effect of the decorations. The floor is of unglazed tiles, with Mosaic center. Combination gas and electric light fixtures of a late design, in rich gold, and very heavy, provide for six gas lights and six electric, 32 candle-power lights, on each fixture.

BATHROOM NO. 1.

To the right of the entrance to the show room is Bathroom No. 1, as illustrated in Fig. 3. This room, which is of the ordinary bathroom size, 13 feet long by 7 feet wide, is very handsome, and most complete in all its furnishings. The prevailing colors of the decorations are ivory and gold. The wainscoting is of cream tiles, the walls are of plastic in imitation of old ivory, and the floor tiled. To the left, immediately on entering is a rolled rim foot bathtub, not shown in the cut, decorated in ivory and gold and fitted with the Harvard combination fixtures. A polished brass towel rack is attached to the wall near the tub. Next the foot bath is a lavatory sink of Algerian onyx, with polished brass legs and fittings, brass soap dish and oval basin, decorated in gold. The bath is an imported porcelain one of the French pattern, mounted on four marble feet, with brass Harvard combination fixtures and a suspended shower bath of brass, having brass flush pipes and brackets. A brass towel rack and sponge holder are attached to the walls, handy to the bath. At the end of the room, to the right of the bath, is an Ejector pedestal closet of ivory ware, with full gold decorations. It has a bird's-eye maple seat and tank. On the right of the entrance is a rolled rim sitz tub, decorated in ivory and gold, and having Yale fixtures of polished brass. Rugs, towels, and a cuspidor, all in colors matching the decorations, with a small gilt chair, complete the furnishings.

BATHROOM NO. 2.

This room is on the left of the entrance to the showroom, and is 12 feet long by 6½ feet wide. The prevailing color here is old pink. The wainscoting is of pink tiles, and the walls are treated in leather effect of a tile pattern. The floor is of white vitrified tiles, of a brick pattern. The room contains a lavatory washstand, with top and back of St. Sylvester pink marble, and an oval basin decorated in pink and gold, low-down Fuller pattern faucets, nickel-plated legs, octagon-shaped trap nickel plated; a washout closet, decorated in pink, with natural cherry seat and tank; a Madeline enameled iron bathtub, with iron feet and skirting, decorated with tiger lilies on pink ground, and fitted with Yale combination fixtures and nickel-plated shower bath, towel rack, sponge basket and soap dish; rugs, curtains and towels in colors harmonizing with the decorations, and a small chair of natural cherry.

BATHROOM NO. 3.

This room is entered from No. 2, which it resembles in size, excepting a recess in which the washstand is fitted. The prevailing color here is blue. The wainscoting is of blue tiles, with a fancy border, and the walls are finished in leather effect to match the tiling. The floor is composed of vitrified tiles, octagon in shape. The room contains a lavatory washstand of Birdelia marble, with basin to match, and nickel-plated legs and fittings; an Ejector pedestal closet, blue and gold decoration, with seat and tank of quartered oak and nickel flush pipes and brackets; an Albion enameled iron bath, with rolled rim and plain feet, ivory, brown and gold decoration, combination fittings of the Yale pattern, nickel-plated soap dish, sponge basket and towel rack; rugs and towels in colors to match the decorations, and a small chair in quartered oak.

The bathrooms are all lighted by electricity.

TRAPS AND VENTS.

ROSENFIELD BROS. are a new firm just starting in the plumbing, gas fitting and steam and hot-water heating business at Rock Island, Ill.

E. M. LANG & CO., Portland, Maine, have a novel and attractive exhibit in a full-rigged four-mast schooner, with five jibs. The feature of the exhibit is best illustrated by a "bull." Every rope on the vessel, with the exception of the ratlines and lanyards, is made of solder. The boat is loaded with miniature pigs of lead and tin, coils of wire and rolls resembling tin plate. The hatches being off, she seems to be loaded below deck with solder drops of various sizes and shapes. The house makes a specialty of wire, drop and stick solder and general supplies for can-goods packers. All the various shapes of solder shown are stated to be made by the firm's patented machinery.

THE PLUMBING FIRM of Williams & Cunningham of Schnectady, N. Y., has been dissolved. James T. Wasson of that city will hereafter be associated with Delos H. Williams and the firm will be known as Williams & Wasson.

THE PLANT OF DAWES & MYLER, at New Brighton, Pa., which was destroyed by fire last November so completely, has been entirely rebuilt, and is now in full operation in every department. In rebuilding, the lessons of past experience and a careful study of their requirements have been used to secure what they claim is a perfect plant for making white enameled iron bathtubs and sanitary iron goods. Having lost all of their cuts, photographs and catalogues in the fire, they are now busily engaged in the preparatory work of getting out a new catalogue, which will be of interest to the plumber who does high-grade work.

THE RETAIL STORE.

The Blue Band Tip-Top Can.

The cut herewith shown is of an oil can being put on the market by the Youngstown Stamping Company, Youngstown, Ohio. The can is described as being made of heavy material, suspended on a strong frame, and so balanced as to be readily tilted for filling lamps or gasoline reservoirs. The outlet is controlled by a spring, which is designed to close the instant the thumb is removed, to render evaporation or leakage impossible. The can is made only in 5-gallon size, and combines, the manufacturers claim, all requirements in simplicity, durability and neatness.

The Blue Band Tip-Top Can.

Wilde's Twine Cutter.

A. L. Wilde, 252 Friendship street, Providence, R. I., is introducing the twine cutter, as illustrated herewith. It consists of a screw hook, with a slot on the inner side of the curve, in which a sharpened steel cutting blade is secured. The cutter is designed to be screwed into the counter or other woodwork, near the place where packages are tied, or string to be cut. Drawing the string across the blade severs it at any desired place. The advantages claimed for the cutter are the saving of string, neatness in the appearance of the packages and the fact that the device is always where it is placed.

Wilde's Twine Cutter.

Economy Shovel.

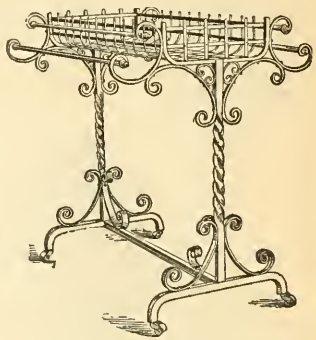
A. M. Rosa & Co., Ilion, N. Y., is offering the shovel illustrated herewith. The shovel is made to meet the demand for a narrow bowl scoop shovel, with long handle, 4½ feet, nearly on a straight line with the bottom of the bowl. The shovel is recommended for feeding coal in furnaces, boilers, &c., and for taking ashes from pits. It is referred to as being useful for a variety of work, being light, strong, serviceable and cheap.

Economy Shovel.

The first report of the Board of Equalization and Assessment of Cleveland, Ohio, shows a gain in the city's tax valuation of $4,079,896 for the year.

Toilet Table.

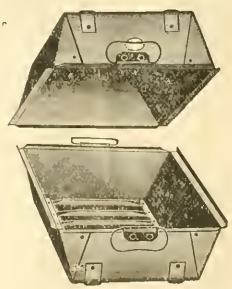
Ludlow-Saylor Wire Company, St. Louis, Mo., are manufacturing a toilet stand, as shown in the accompanying illustration. The holder is designed for sponges and is provided with towel racks on each side. The sponge holder or receptacle is of brass, the mesh being sufficiently large to allow the air to circulate through it freely, thus thoroughly drying the sponge. The table is regularly made in nickel-plated brass, but will be made to order of any metal desired.



Toilet Table.

The Columbia Roaster and Baker.

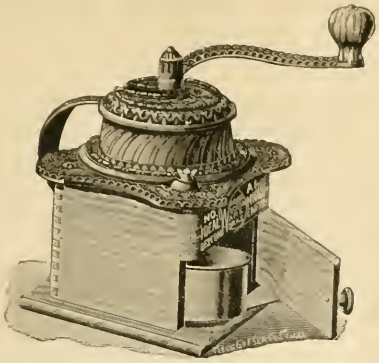
The Star Baker Company, Bellville, Ohio, are offering this article as shown herewith. The lower pan has a rim on the sides upon which the top pan rests, when in use, which holds the top pan from slipping sideways. The handles on the bottom pan form a clasp at each end, holding the pans together. The manufacturers claim the pan is made of excellent material, well constructed, easily adjusted and that it does good work.



The Columbia Roaster and Baker.

Ideal Coffee Mill.

Waddel Wooden Ware Works, Greenfield, Ohio, are placing a new line of box coffee mills on the market, one of



Ideal Coffee Mill.

which, the No. 1 A, is shown in the accompanying illustration. The strong features claimed by the makers of the mill are the large bronzed hopper, artistic grasping handle, rapid grinding burrs, and round tin cup with automatic ejector. The burrs, it is stated, are so constructed as to draw the coffee berry into the grinders. The manufacturers state that a large amount of coffee can be ground with comparatively little labor.

P. & A. Royal Lamp No. 835½

The Plume & Atwood Mfg. Company, 18 Murray street, New York, are putting this lamp on the market, as

Fig. 1.—P. & A. Royal Lamp No. 835½.

shown herewith. The lamp is of the central-draft pattern, while the wick is raised by lifting the wire which projects above the font at the right-hand side of the cut. A feature of the burner is the lighting lift, shown in Fig. 2, which lifts on a spiral movement and remains in position while lighting. The part of the burner in Fig. 2 is removable from the lamp to make it easy to clean. It is held firmly in position by notches at its base, into which lugs fit to prevent its turning when lifting for lighting. The manufacturers claim that the lamp

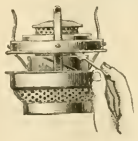


Fig. 2.—Spiral Lift.

gives a proportionately larger amount of light for the oil consumed.

Globe and Monarch Oil Cans.

The accompanying cuts represent cans put upon the market by the Winfield Mfg. Company, Warren, Ohio. The Globe can and lamp filler, as shown

Fig. 1.—Globe Oil Can.

in Fig. 1, is manufactured in all tin, and in galvanized iron with tin tops. It is explained that the can has an extra-large-sized filling hole to accommodate large-sized funnels, while the filling hole and pouring spout are located at opposite sides of the top to avoid having the oil run from the can screw when filling a lamp. The flutings are referred to as adding to the general appearance of the can, as well as to the strength of the top, and the spout as being reinforced.

The Monarch can for oil and gasoline, Fig. 2, is described as being made of heavy galvanized iron, hung in a frame of bar iron, finished with japan. The can is removable from the frame

Fig. 2.—Monarch Oil Can.

when taken to be filled. The stream, when passing through the large outlet, may be regulated by pressure on the spring valve.

Ideal Double-Acting Spray Pump.

The accompanying illustration represents a pump offered by the Deming Company, Salem, Ohio. In use the double-wing oscillating piston is described as being operated by a lever connected to a shaft, passing through the hub in the center of the cylinder cap, thus rendering the pump double acting. The pump is made in both iron and brass, the suction of both being fitted with 2½ feet of 1-inch iron pipe, with strainer on the end to prevent leaves or other foreign matter from getting in the pump. It is stated that an absolutely constant stream is produced by the pump, and that it can be

Ideal Double-Acting Spray Pump.

placed either on the end or side of a barrel. The pump is especially recommended by the makers for grape growers, and the suggestion made by them, that for spraying with Bordeaux, ammoniacal mixtures, &c., the all brass pump should be used.

ROOFING AND CORNICE.

Laying Steel Roofing.—II.*

BY L. S. BONBRAKE.

PATCHING ROOFS.

If through accident, or from whatever cause, a large hole is made through the body of the roof, it can be repaired by cutting out the damaged part in a square or oblong shape, as shown in Fig. 2. Notch the corners ½ inch in from the edge, as at B, Fig. 2, and form a flange on all the sides at right angles to the sheet, except at the bottom, which should bear outward, so to lock under the flange on the patch F, Fig. 2.

The piece of metal F is cut to fit into the space, with ¼-inch edges turned at a right angle, except at the bottom, which edge should remain flat. This is inserted into the space formed by the flanges of the sheet, and the bottom edge of F is turned over and pinned under the bottom flange. Use flat pliers to do this. When pinned under mallet the bottom down solid, after which use the pliers to fold the high flanges over the lower ones, when all the sides can be malleted down solid, forming a secure water-proof patch, Fig. 3, without the use of cement, except, possibly, a very little at the corners. When finished the water will run over the seams and not into them.

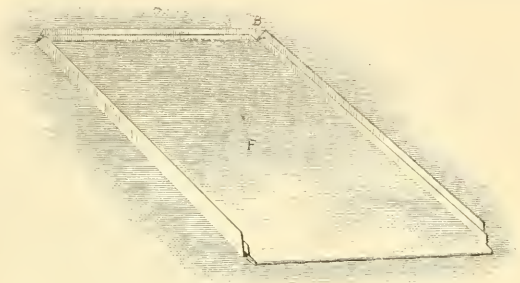

Fig. 2.—Patching a Roof.

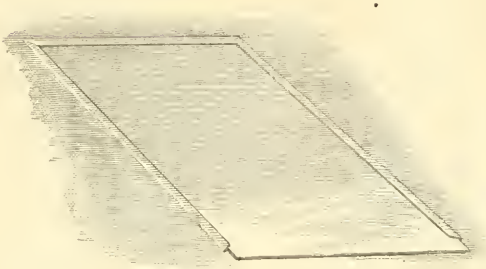

Fig. 3.—Roof Patch Completed.

FLASHINGS FOR FIRE WALLS.

In forming flashings for fire walls the corners should be seamed and the same treatment should be given the corners of chimneys when the chimney extends out from the fire wall into the body of the roof, as is oftentimes the case. In Fig. 4 is shown the sheet in the flat, with the corner cut out and ready for forming the flashing. Fig. 5 shows the flash formed, and the corner edges formed ready to seam, which may be finished by malleting over a square block.

STANDING SEAMS.

When the pitch of the roof will allow of a standing seam, it is preferable to a flat malleted seam, inasmuch as it provides for the expansion and contraction of the metal used, and prevents "buckle" (raising of the sheets in the center), and will not crack or break. The surface for a roof made with a pitch of from 1 to 1½ inches to the foot has been found more desirable than with less, and a "one-fourth" pitched roof is preferable, although, by the use of double lock cross seams, Fig. 6, the metal has been used for roofs with less than ½ inch pitch, and has given very good satisfaction. However, a pitch of ½ inch or less to the foot is dangerous for material of any kind, and should be avoided when possible. The roof may prove fairly good for a time, or while the building is new, yet the natural tendency of timbers is to shrink, and of the building to settle and create depressions, or sinks, to hold water and catch dirt, all of which tend to destroy the life of the metal and in a short time result in leaks.

Fig. 4.—Sheet Cut for Flashing.

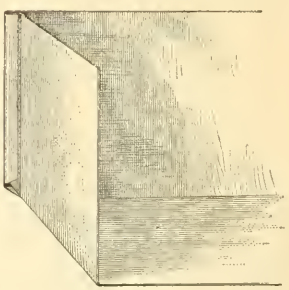

Fig. 5.—The Flashing Formed.

LAYING STEEL ROOFING.

* Copyrighted, 1893, by L. S. Bonbrake.

DOUBLE-LOCK CROSS SEAM.

The double-lock cross seam, Fig. 6, used for pinning or connecting the sheets of steel, as mentioned in this article, has been known and used for years in terne roofing when seams were not soldered; yet it is a comparatively new departure for steel roofing manufacturers, and has entered into the construction of this style of roofing to a very limited degree until of late years. A want of the proper tools or machines for speedily and perfectly turning the hem and fold (double edge) on the ends of the sheet, and the necessity of using very soft material to avoid cracks and breaks, have barred it from general use. However, American genius has been at work, and machines have been invented that fill every requirement for this character of work. This is a long stride in the right direction, as sheets thus joined are free from danger of leaking at the cross seams, and long strips of material may be handled on the roof as roughly and carelessly as terne roofing with soldered seams, with no danger of coming apart or being injured. A double lock is formed by first notching the end of the sheet on the edge which is to be formed for the high edge of the seam. This notch will vary in size to accord with the width of the high flange and width of the seam. After notching the first fold on the end of the sheet is then made, usually $\frac{3}{8}$ inch wide; the edge of the opposite end is turned on the reverse side of the sheet in like manner. Twelve sheets are usually treated in this manner for a roll of steel containing material for covering or laying 200 square feet. After the edges have been formed as described, the sheets are slipped together, interlocking one edge in the other. The seam is then pressed close and firmly together. The slight space allowed between the edges (one being folded $\frac{3}{8}$ and the other 4-8 inch) provides for the contraction and expansion of the seam and obviates all trouble and occasion for complaint at this point of the roof.

Fig. 6.—Double Lock Cross Seam

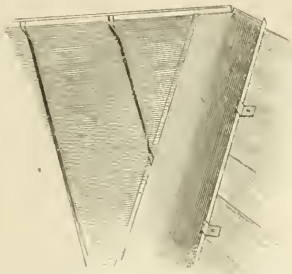

Fig. 7.—Joining Roof Strips and Valley Sheet.

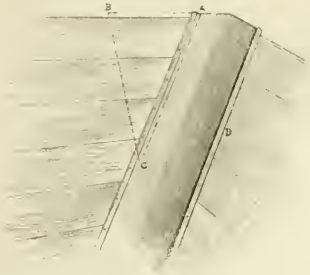

Fig 8.—Measuring for Miters

GUTTERS AND VALLEYS.

The terms gutters and valleys are at times confounded one with the other. In the Eastern States a built-in trough, in any part of the roof, is known as a "valley," while in other sections the term "valley," as applied in connection with a roof, is used only as defined by Brande—viz.: "The gutter or internal angle formed by two inclined sides of a roof." Webster defines a roof gutter as "a channel at the eaves of a roof for conveying away the rain."

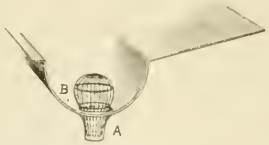

Fig. 9.—Gutter Outlet with Strainer.

Fig. 10.—General View of Gutter.

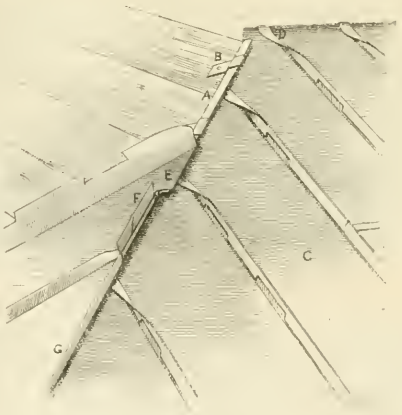

Fig. 11.—Laying Sheets at Hip.

LAYING STEEL ROOFING.

In laying a roof with valley we find the most essential point to observe is the proper connection of roof strips to the valley sheet.

Large, wide seams are to be avoided. While they are more readily fastened together than if narrow, they invariably spring at the outer edge, and, though they may not leak, form a recess for the retention of dirt. This is prevented by using a narrow, $\frac{1}{2}$-inch, edge, which can be malleted down solid, and to stay. The valley sheet should be bent to conform to the angle of the roof, and with a $\frac{1}{2}$-inch edge, or hook, formed to receive the edge or end of roof strip and laid to place and secured by anchors, as in Fig. 7, instead of nailing under edge, as shown at D, Fig. 8.

It must be remembered that in laying the roof down the

valley the roof strips gain in length. By reason of an edge turned up for seaming, the roof strip is taken up the valley the width of edge turned, and hence is longer. In laying up the valley the strips shorten, hence must be cut longer than measurement before edging.

It is unnecessary to lose or waste stock in cutting miters, as with a little care and turning all corners can be used except possibly the pattern. To cut the first miter, supposing the roof strips to be 27 inches wide and the first edge for seam 1 inch, measure from joint A, Fig. 8, of valley sheet at comb, extending 1½ inch over turned edge for strip to hook on to valley, out on comb to B 27 inches, then square down the roof to C and allow 1 inch projection over comb line for comb seam on first side laid.

Equal care should be taken with roof gutters as with valley, for a poorly constructed gutter in a building entails manifold annoyances and the destruction of property. Poor workmanship leaves its trade-mark in black streaks from the top to the bottom of the building, defacing and marring the beauty of the paint. If copper or sheet lead is too expensive, the best quality of extra-coated terne plate should be used. It will cost more than common material, but is the least expensive to the builder when wear is considered, and will redound with credit to the mechanic who insists on working it. If double-lock cross seams are used, and thoroughly soaked with solder, there is no danger whatever of seams breaking or bursting in the coldest weather, as they will stand the most severe tests of freezing and thawing.

Care should be taken to have the outlets sufficiently large and at frequent intervals, firmly secured. A countersunk outlet, A, protected by wire strainer, B, Fig. 9, is recommended. The width of material is determined by the width of ledge or top board, B, Fig. 10, depth of gutter, C, and the pitch of roof. The back edge of gutter sheet, A, should in no instance be less than from 4 to 5 inches higher than the level of the gutter, as shown from D to A, Fig. 10, and, if convenient, more stock should be used. This point should be especially observed when shingles form the main part of the roof, as capillary attraction tends to draw the water above the base of the shingles, and is often the cause of water pouring down on the inside wall of building.

The angle or pitch to cut the roof strips for hips can be obtained by following the rule given for valleys, except to take the eave for the base of measurement. The gain and loss in lengths of roof strips working up and down hips is the same as in valleys, and should be taken care of. In laying the first side of hip the material should project over hip line 1 inch. When the entire side C has been laid, with seams finished, mallet the seams down a few inches back from hip line, with the open side of the seam turned under, as at D. Then the 1-inch tongs are used to turn the edge A, Fig. 11, overlapping hip line back upon the sheets laid. The line is then secured by nailing the anchor B between the seams. The adjoining edge E is laid projecting over edge A ¾ inch. When the line has been laid with seams formed they are malleted in the same manner as first line, and the wider tongs are used for turning both edges perpendicular, as at F, when the higher edge is seamed over the lower, as at G, making a firm and secure finish. The roof comb is formed and finished in a similar manner.

(To be continued.)

Slip-Joint Eave Trough.

The Fostoria Steel Roofing Company, Fostoria, Ohio, are calling the attention of the trade to their new style of eave trough which they are placing on the market. They especially allude to the slip joint, which they say is watertight and which they guarantee to be particularly strong and easy to put together. The lap of the slip joint is cut away in such a manner as to allow the outside lap to extend around and over the bead, which is thoroughly fastened on the inside of the trough, making the bead where it slips together three thicknesses of metal and thus giving it great strength. The accompanying illustration shows the appearance of the trough and indicates the construction of the joint. The tong of the bead is entirely cut away, leaving it open to admit the next joint of pipe. This feature is especially alluded to by the manufacturers. The trough is made in lengths of 10 feet 2½ inches, so that when placed on a building they make full 10-foot lengths. They are made with two sizes of beads, ½ inch for 3, 3½, 4 and 5 inch trough, and ¾ inch bead for larger sizes. The troughs are made both right and left hand.

Slip-Joint Eave Trough.

FLASHINGS.

According to the annual report of the Saginaw Board of Trade for 1892, which has just been issued, several firms are engaged in the manufacture of galvanized iron cornice, and other similar work in the city of Saginaw, Mich. The principal shops are those of J. C. Albright, Alexander Jacobi, and Morley Bros. A new concern which is reported to be doing a rapidly growing business in that city is the Asphalt Roofing Company.

Scott & Co, Cincinnati, Ohio, having added cornice and sheet-metal work to their iron roofing business, have leased the premises adjoining their present quarters and will be in position to give all orders, in the line mentioned, prompt attention.

The Berger Mfg. Company, Canton, Ohio, issue a handsome illustrated catalogue and price-list of cornices, finials, window and door caps and crestings of their manufacture. The catalogue measures 11 x 14 inches, is bound in tinted paper and contains a variety of handsome goods. The first seven pages show different designs of cornices which they manufacture. Next come window and door caps of galvanized iron of various shapes and styles. Several pages are devoted to finials, and galvanized iron crestings are illustrated in many different styles; also creating blocks and finials. Along with the catalogue is sent a supplemental sheet to their 1893 catalogue, illustrating Berger's imperial steel pressed brick, rock-face brick, rock-face stone, sheet-metal ceilings, &c.

M. Hass, cornice maker and tin worker, 2628 Carlson street, Pittsburgh, Pa., has recently brought out a device for hanging pictures on in rooms fitted with sheet steel or iron ceilings. The device consists of a molding some 4 inches deep, formed out of sheet metal, and which makes a cornice around the ceiling of the room. The lower edge of the molding is curved around so as to give a ledge, to which picture hooks may be readily attached.

We are indebted to the American Wire Glass Mfg. Company, Tacony, Philadelphia, for a pamphlet issued by them giving particulars about this new material and the uses to which it is applicable. The large works which have recently been erected by the company for the manufacture of wire glass have been in operation for nearly a month, and everything is reported as working very satisfactorily. The present output is about 3000 square feet a day, but the works will shortly be running to their full capacity of 5000 square feet. Orders and inquiries for their products have been received by the concern from all parts of the world, and customers to whom deliveries have been made are said to be very favorably impressed with the merits of the wire glass. A large number of orders are in hand, and the outlook for this material appears to be very promising. The American Wire Glass Mfg. Company have an exhibit of their goods at the World's Fair in Section H, Block I of the Manufactures and Liberal Arts Building, where samples and full information in regard to their productions can be obtained. The glass is made of any grade, from rough skylight up to the best polished plate.

The report is current that Jones & Laughlins of the American Iron Works, Pittsburgh, propose to make important improvements in their facilities for rolling steel billets. It is stated that the plans aim at rolling direct from the ingot billets down to 1½ inches.

TIN PLATES.

The Tin Plate Report.

Our Washington correspondent sends us the following letter under date of June 13:

Ira Ayer, special agent of the Treasury Department relative to the production of tin and terne plates in the United States, was at the department to-day looking after the final touches to his special report on that subject. The report has been referred to Assistant Secretary Hamlin for analysis and examination, which process hitherto has been a sort of perfunctory affair at the hands of Assistant Secretary Spaulding.

This sudden change of tactics naturally creates considerable comment and speculation and diverse conclusions and has also led to the allegation that Col. Ayer's report is to be suppressed by the departmental free traders who have gotten into place under the wing of the new *régime*.

Secretary Carlisle said to your correspondent to-day: "The charge has been brought to my attention that we are purposely delaying, and, in fact, suppressing the report on the production of tin plate in the United States made in pursuance of provisions of the act of 1890. The statement, which has also been given currency in certain newspapers, is not true. The report has been referred, and when Assistant Secretary Hamlin shall have had time to give it a careful examination it will be made public."

An inquiry in another quarter elicited the significant and important fact that it might be some weeks before the report could be examined, in other words, visible to the naked eye of the public. The parties who are interested in the data contained in this report are now surmising everything and are interrogating themselves and each other inwardly and outwardly as to whether there is to be any doctoring of the report or the application of other occult arts of departmental or official methods or political mathematics. At any rate, the suspicions which have been aroused are sufficient to keep the eye of scrutiny riveted upon Assistant Hamlin and the output of his sifting of Special Agent Ayer's statistics. Every one who is booked on schedule C knows that the existing duty of $2\frac{2}{5}$ cents a pound on tin or terne plates, to take effect July 1, 1891, as prescribed in the act of 1890, is subject to certain limitations, to the effect that on and after October 1, 1897, tin plates and terne plates lighter in weight than 63 pounds per 100 square feet should be admitted free of duty, unless it should be made to appear to the satisfaction of the President (who should thereupon by proclamation make known the fact) that the aggregate quantity of such plates lighter than 63 pounds per 100 square feet produced in the United States during either of the six years next preceding June 30, 1897, had equaled one-third the amount of such plates imported and entered for consumption during any fiscal year after the passage of the act and prior to October 1, 1897. The law provides that the amount of such plates manufactured into articles exported and upon which a drawback shall be paid shall not be included in ascertaining the amount of such importations, and also provides that the amount or weight of sheet iron or sheet steel manufactured in the United States and applied or wrought in the manufacture of articles or wares of tinned or terne plates in the United States, with weight allowance as sold to manufacturers, or others, shall be considered as tin and terne plates produced in the United States within the meaning of the act.

These are the obligations of Congressional legislation to the manufacturers of tinned and terne plates in the United States, and under which capital embarked in these enterprises. Any attempt of the Congressional and executive free trade tariff reformers to break the faith of the Government embodied in this solemn and binding enactment would be an outrage upon every sense of public honor.

On the first day of the coming October four years will remain of this period of limitation as to duty, and when it will be determined whether tin plates shall pay duty or go on the free list.

The report of Colonel Ayer for the six months ended December 31, 1892, showed a total of production in the United States:

	Pounds.
Tin plates	9,750,106
Terne plates	20,959,110
Total	30,709,216

Of that amount 13,963,531 pounds being made from American and 16,745,685 pounds from foreign black plates. It is learned that the ratio of increase of production for the six months which will end on June 30 will be much larger. The aggregate importations of tin and terne plates and taggers' tin for ten months ending April 30, 1893, is given at 480,777,931 pounds, as against 315,102,936 for the same period in 1892. There was a decrease, however, in the April, 1893, importations as compared with April, 1892, the latter showing 70,489,102 pounds and the former 66,498,618.

Sheet Iron and Tin Plate.

The regular monthly meeting of the Iron & Steel Sheet Manufacturers' Association was held in its headquarters in the *Times* Building on Tuesday the 6th inst. J. G. Battelle of the Piqua Rolling Mill Company, Piqua, Ohio, was chairman, and John Jarrett secretary. After considerable routine business had been disposed of the wage scale question came up for discussion, and occupied the attention of the members during the balance of the meeting. A conference committee of seven sheet manufacturers, with J. G. Battelle as chairman and John Jarrett secretary, was appointed to meet a similar committee from the Amalgamated Association. We are advised that the manufacturers will ask that some of the extras in the scale now in force be eliminated, and also that clause 2 in the sheet-mill scale, reading as follows, be stricken out: "Ten (10) per cent. added on all steel by whatever name called, No. 22 and lighter." A meeting of these two conference committees will be held at an early date.

On the next day, Wednesday the 7th, the semi annual meeting of the Tinned Plate Manufacturers' Association of the United States was held at the same place. Routine business covering operations of the association for the past six months was disposed of and the wage scale governing tin house labor was then taken up. The manufacturers had previously been informed that the washmen would ask an advance of 25 per cent. over present rates, equivalent to 15 cents per box, instead of 12 cents, the present rate. It was the sense of the meeting that the scale of wages now in force was satisfactory to the manufacturers and would be signed by them for another year, but any advances asked over present rates by the workmen would be vigorously opposed. A Conference Committee of three, consisting of Wm. Banfield of Wallace, Banfield & Co., Limited, Irondale, Ohio; W. C. Cronemeyer of United States Iron & Tin Plate Mfg. Company of Demmler, Pa., and W. B. Leeds of the American Tin Plate Company, Ellwood, Ind., was appointed to confer with a similar committee from the Amalgamated Association. No time has been arranged for a meeting of these two committees, but they will come together at an early date. An election of officers of the Tinned Plate Manufacturers' Association to serve for the ensuing year was also held, and resulted as follows: W. C. Cronemeyer, president; Clarence Britton, vice president, and John Jarrett, secretary.

SCRAP.

The Locust Point Iron and Steel Works Company, Baltimore, Md., have their tin mills and tinning plant in full operation, turning out an average of 1000 boxes of IC coke brights daily.

The black plate mill of the Cumberland Steel and Tin Plate Company, Cumberland, Md., which recently went into a receiver's hands, is reported as running steadily, with a good demand for their output of black sheets for tinning purposes.

The works of the United States Iron and Tin Plate Mfg. Company at Demmler, Pa., will be closed down on July 3, and remain closed for three or four weeks. Some extensions and improvements will be made during the shut down. As announced before, this firm are renewing their boiler equipment and have adopted the plan of placing the boilers over the furnaces, utilizing the waste heat from the furnaces for making steam.

At the regular monthly meeting in June of the Chamber of Commerce of New York a resolution was adopted expressing the opinion of that body that the Sherman silver-purchase law should be repealed by Congress at the earliest possible date.

STEAM AND HOT WATER.

Circulation of Steam Without Pressure Above the Atmosphere by the Andrew G. Paul System for Removing Air.*

BY A. B. FRANKLIN.

At the last Master Steam and Hot-Water Fitters' Convention, held in Boston, May, 1892, a paper was read by O. L. Breckenridge, which gave a description of the application of the Andrew G. Paul system to two heating plants. One description was of a house heating apparatus in which the circulation of steam could be automatically controlled at temperatures ranging from 150° to 212°. The other was of an office building plant where the system had been applied, the exhaust steam from an elevator engine being used in the radiators without any back pressure.

Mr. Breckenridge's paper was, I judge, received with considerable interest, but looked upon, perhaps, as advancing a patent system of steam heating, which introduced more theoretical than practical advantages. . . .

Knowing it will be to the advantage of the master steam fitters to become as thoroughly acquainted as possible with the workings of the system, I take pleasure in describing some of the work we have done and the results obtained.

DESCRIPTION OF A PLANT.

One of the first plants to which we applied the system was in two adjoining buildings, used for retailing custom and ready-made clothing on the first floors, and for the manufacture of the goods on the other floors. The buildings, which were heated from one steam plant, are respectively 30 x 220, four stories high, and 45 x 220, five stories high, and contained about 30 radiators and pipe circulations, with a total radiating surface of 5600 feet, which amount is rather scant for the space to be warmed. There was in the basement one engine for power and lighting that was developing an average of 30 to 40 horse-power in the morning and nearly twice as much in the latter part of the day, and one engine for each carrier of about 10 horse-power, also one steam pump for running a passenger elevator. The steam was generated in three horizontal tubular boilers, two of which were generally run high pressure for power and one low pressure for heating. The exhaust was made use of for heating feed water and also, under back pressure, in the heating system at such times as a low pressure would maintain sufficient circulation in the radiators. The piping in these buildings is in fair shape, but, as I said before, the radiating surface is scant, and previous to the application of the air-removing system they found it necessary on cold mornings to carry 10 to 15 pounds pressure for several hours to force the air out and establish a proper circulation, at which times they could not afford to have that much back pressure on their engines, so the exhaust steam would go to waste. After the air-removing system was attached, the exhaust from both engines and the pump was used at all times, and a reducing pressure valve was applied between the yoke of the high-pressure boilers and the heating main, and this valve was set to work at the atmosphere, so that at all such times as the exhaust was insufficient for the building, live steam would automatically feed in to supplement the exhaust without the slightest back pressure.

ADVANTAGES OF THE SYSTEM.

The advantages and economy of the air-removing device were made manifest not only in the use of exhaust steam, but also in the morning before the engines were started, when by starting the air exhauster air would be drawn from the radiators to an extent that would establish a perfect circulation in much less time than formerly, and that at atmospheric pressure, against 10 to 15 pounds that was previously necessary. I should be pleased to give you the number of pounds of coal saved on this plant by the use of the system, but am not able to do so exactly, for the reason that we offered to take the job and furnish the license to use the system, on the basis of two years' saving, or the owners should pay us our price at the end of 30 days' trial. They discovered in that time that they could dispense with the heating boiler at nearly all times, and thus save the expense of one fire, so the owners, evidently not caring to give us the savings, sent a check for the stipulated amount.

This opinion was given last winter, so, to make sure how they felt after the entire season's trial, we a few days ago sent a stranger to them to inquire if they could recommend the system to one owning a heating plant, and the manager of this clothing house answered him in this way: "If I was the owner of a steam heating plant that was without the Paul system of removing air I would not sleep to-night till I had ordered the application of the system."

By the Paul system in a corset factory we took the exhaust from one 15 horse-power and one 10 horse-power engine that were brought together and taken through a grease extractor and then made use of in 2400 feet of 1-inch pipe circulations and 300 feet of surface in a Sturtevant heater to which was attached an 80-inch fan with fan engine that was designed to distribute 600,000 cubic feet of air per hour warmed to 70° throughout the factory for ventilation. Of course live steam was connected to heating main through a reducing pressure valve, that would make up any deficiency of exhaust. Here the results were very satisfactory, the exhaust was made use of without a particle of back pressure, and a perfect circulation was obtained.

Another building where we installed the system was a five story wooden shoe factory, 40 x 160, also one 210 x 110, one story in hight. Here they had a 50 horse-power Corliss engine, from which the exhaust, after passing through the feed-water heater, was circulated without any back pressure in connection with live steam if necessary by a reducing valve through a Sturtevant heater containing 4300 feet of 1-inch pipe and through 300 feet of 1-inch circulations which were placed on walls under the benches. The peculiar feature of this job was that several of the circulations were four-branch, of 1-inch pipe and 330 feet long, and that by use of the system here exhaust steam could be circulated throughout these long coils without the slightest back pressure.

APPLIED TO INDIRECT HEATING.

There is one other job that I wish to describe on account of its size and because of some actual tests which I will mention shortly. The buildings in question are owned and occupied by a concern manufacturing silver ware. The buildings are three stories high, and, I am told, cover over 4 acres of ground, and the heating of these immense works is accomplished almost entirely by one Sturtevant heater. The heater is composed of three stacks of 1¼-inch pipe placed in such a position as to form three sides of a square, the cold air being taken through the heater in three directions into the central heating chamber, where it is taken by two fans (each run by its own separate engine) and delivered to the different parts of the buildings. Each of the three stacks is made up of seven sections. The bases of three sections in each of two stacks are fed by the exhaust from the fan engines, and the remaining 15 sections are supplied by the exhaust from a Corliss engine.

The entire heater contains 24,150 feet of 1¼-inch pipe, or a little over 4¼ miles, or 10,500 feet of radiating surface. The Corliss engine was developing last winter from 300 to 400 horse power, the variation being on account of the engines furnishing power for the dynamos for the electric lighting. A card taken from this engine shortly before the system was applied to the heater showed 400 horse-power, the initial pressure being 100 pounds and the mean effective pressure 41.7 and the back pressure 4 pounds. All that was necessary to apply the Paul system to the Sturtevant heater was to drill a ⅝-inch hole in the return end of each sectional base and from each tapping to run a ⅜-inch stand pipe about 5 feet high, put a Jenkins' automatic air valve on the top of each, then yoke all the automatics together and run a ¼-inch air pipe to engine room and thereon place the exhauster, which was supplied with a ⅝-inch live steam connection.

The exhaust pipe from the engine is 10-inch, and goes into the basement under the engine and then about 10 feet through the basement wall and up about 30 feet on the outside of engine house to the atmosphere. Just before going through the wall there was on this exhaust a 10-inch back-pressure valve with the handle extending through the floor to be regulated by the engineer.

The pipe that carried the exhaust to the heater, which was about 175 feet away, was 6-inch, well covered and hung in an underground duct till it entered the heater house. On this pipe was a grease extractor. It might be well to say that the heater was well piped before we started to apply the system and they were getting good results with from only 2½ to 4 pounds back pressure. . . .

When the work of applying the system was completed and we were ready to start the exhauster it was about four o'clock one afternoon in January, after they had put the dynamos to work, at which times they always run the pressure up on the engine to from 80 to 100 pounds and the back-pressure gauge showed at this particular time 5 pounds. We first started up the exhauster and then opened the back-pressure valve as wide as possible, but we still had about ¾ pound due to the weight of the valve, so we found it necessary to take the insides of the valve out altogether and then the back-pressure valve was merely a coupling on the pipe. But the steam continued to flow 175 feet through a 6-inch pipe to the heater and filling the 4¼ miles of 1¼-inch pipe, in preference to going 30 feet to the atmosphere through a 10-inch pipe.

Now, the question arose in the mind of the master mechanic in charge as to the amount of heat he would get working on this lower pressure, and, consequently, lower temperature, and he remarked that, although we removed all the back pressure from the engine, if the coils of the heater were not as hot as before he would not accept the system, as they had nothing to spare before. So he made a test the next day with 4 pounds back pressure and without the aid of the system, taking the air from outside at 18° above zero, passing through the heating coils and delivering it to the fans at 130°. Then a test was made without any back pressure by the system, and the temperature of the air was raised to 148°, a gain of 18°. In other words, in using steam at atmospheric pressure, a temperature of 212°, the air that passed through the heater was warmed 18° warmer than when steam was used at 4 pounds pressure, a temperature of 225°, showing conclusively that the air-removing system made the surface enough more effective, or made enough more of the surface effective, if you please, to make up the difference in temperature and 18° besides. Other tests were made afterward which did not show such a large gain, but the air had been removed by the system shortly before, and even then there was a gain of 8° to 10° for the respective tests.

SAVING IN STEAM PRESSURE.

It was noticed also at once that where it had been necessary to carry 100 pounds pressure on the engines before, 90 pounds only was required with the back pressure removed. Another point of economy on this job came in at night, when they were always in the habit of carrying 5 pounds of steam on the heater through a reducing pressure valve. Since the application of the system the reducing valve has been set

* Read at the Chicago Convention of the Master Steam and Hot-Water Fitters' Association of the United States.

to work at the atmosphere, feeding steam to the heater without pressure.

The question will probably arise as to how much steam it requires to run the exhauster, so I will say that a satisfactory test, made by condensing the discharged steam from the exhauster, gave us in ten hours 300 pounds of water, which, if figured 10 pounds of water per pound of coal, would give 30 pounds coal, or about one shovelful for ten hours, which amount is, of course, extremely small in comparison to the saving.

The system is also applicable to all kinds of drying cylinders, slashers, &c. I have already attached the system to several paper machines, keeping them free from air and water, and in each case the work has given a large saving in fuel or an increased production on the same amount of fuel, and giving a better quality of paper on account of the evenness of temperature which can be maintained. I have no doubt that the Paul system will in the near future be extensively adopted throughout this and other countries as an attachment necessary to complete most any heating plant, and that each application will show benefits, both in saving and circulation, corresponding to the conditions of the plant to which it be applied.

A Look Ahead.

We reprint the following extract from a paper read by H. J. Barron at the Chicago convention of the Master Steam and Hot-Water Fitters' Association of the United States:

In the near future direct radiators will be designed that are poems in art; I would not by this state that there are not pretty radiators at present, or that a radiator is a hideous but necessary monstrosity. The radiator specialist has done well in the last ten years; we will encourage him to do better. The radiator of the near future will encircle the fire place; it will be the fire place mantel; it will have its gas logs and its ventilating flue, and air will be admitted back of it, either from the room or from outside; it will be connected with the steam or hot-water boiler in the cellar, with one pipe, not exposed in the room, and regulated with a foot valve, having also connection, of course, with the thermostatic regulator. (This is simply a Backus or similar heater in the room connected with an ordinary heater in the cellar.)

The days of the old style handle valve are over. In fact, the days of all globe valves or globular valves are about over; the straight-way valve is now perfect for all purposes and pressures. This radiator I speak of will, with its gas logs, waste but very little heat, as the gas heat will be utilized in re-evaporating steam or reheating water. Let the radiator man study beauty; his business is an artistic one.

The gate valve is the valve of the future, and exposed pipes on buildings will not be tolerated in an artistic age unless they are also made beautiful. The natural development of architecture will lead to hot-air heating by indirect steam or water and by the use of fans with the indirect heating. Hollow walls will soon become a necessity of architecture, and these we will utilize for sending up to the rooms fresh warm air. It is a curious thing that we guarantee to heat rooms to 70° in zero weather and never do it uniformly. Let any one make the experiment by taking a dozen thermometers, first testing them for uniformity and accuracy, and place one outside the window, another one inside the window, one at the ceiling, one on the floor, another at the vent flue and others at the inside and outside walls, and one just above the radiator or register. It will probably be 10° above zero outside, 80° at the ceiling of the room, 60° at the floor, if it is a first floor and the ceiling is about 11 feet high; 69 to 72° at the exact center of the room; and this will be also about the average of the different thermometers, and it will be probably 65° at the vent flue, and just above the radiator or register, of course, will be found the highest temperature in the room. This difficulty will be overcome by hollow walls and hot-air heat.

In general pipe fitting, I think cast fittings will disappear and be succeeded by malleable and wrought fittings, and also steel fittings. Screw joints will to a great extent disappear, and be succeeded by electric welding and new fittings, and new methods of connecting will dispense with both flange and screwed joints. Progress in the use of new metals and alloys will make many changes; for instance, in the use of aluminum or of alloys of it. And the exhaust steam from engines that is now thrown away in cities will be saved by having one large central main pipe, say 15 to 20 feet in diameter. All engines will have to exhaust into this. Steam for heating will be taken from this whenever required, and the hot water will be used for boilers. Central heating plants will increase; they are only in their infancy. The boilers in these plants will be vertical water-tube boilers, working at 1600 to 1500 pounds pressure. They will not be set in brick work, but have iron casings. Our present practice of setting boilers in brick illustrates our poverty of expedient. A true engineer is a worker in metal, and leaves bricks to the architect. The feeding of coal to these boilers and the removal of ashes will be entirely automatic. Mechanical conveyors will take the coal to the automatic stokers, and, later, the use of petroleum or gas for fuel will become general. Water will, of course, be fed automatically and heated by high-temperature heaters. Boilers will then become complicated machines, worthy of the engineer. There will be no patents on these boilers; we have passed the age of patents. There is not to-day, in my opinion, a valid patent on a boiler or radiator, or on any other article connected with heating or steam engineering. Their value depends on how much litigation the owners can stand. Take boilers: there is hardly a form made to-day that is not shown in Burgh's treatise on boilers to have been introduced 40 years ago. Robert Briggs advocated the abolition of patent laws, and, I believe, claimed that they were never of benefit, as engineers would devise the necessary machines when there was occasion for it. Events seem to point to the fact that patent laws were once of some value, but to-day, as applied to steam engineering, they are only of use to tickle credulous stockholders.

A Successful Heating and Power Plant Furnished for the Cleveland Arcade Company's Building, Cleveland, Ohio.*

BY SAMUEL I. POPE.

The building for which this plant was furnished is located in Cleveland, Ohio, fronting 132 feet on Euclid avenue by 64 feet deep, 11 stories high, fronting on Superior street 180 feet, 64 feet deep and 10 stories high, with a building connecting the two, 5 stories high, 200 feet long, 132 feet wide, with a skylight over same. The ground floor and first floor is used for stores and the balance for offices. The instructions to bidders were to provide an ample power plant for warming the building; elevator service, with surplus of 200 horse-power for electric-light plant, with additional boiler for cleaning.

Four firms were invited to submit plans and specifications. The accepted plans and specifications provided for five tubular boilers 60 inches in diameter, 16 feet long, with 54 4-inch flues 16 feet long of 5-16-inch Otis steel. Twenty thousand square feet of radiation, two duplex boiler feed pumps and separate house pump. The main steam pipe is run to furnish the steam to heaters on the ground floor and first floor and one for the heaters above this floor. This was done to provide for warming the lower floor until 10 o'clock p.m., as the offices would not be used after 6 p.m. The mains are run on the continuous main system, with one pipe connection for each radiator. All mains in basement are covered with asbestos cement covering; the exhaust pipes are run into an expansion tank and through a grease separator before entering the heating apparatus.

The plant has been in operation two years and is furnishing steam and power as follows: Six hydraulic passenger elevators, two hydraulic freight elevators, one hydraulic freight elevator (private), two boiler feeders (duplex pattern), 20,000 square feet vertical tube radiators (only about 13,000 feet in use) at a pressure of 2½ to 3 pounds to the square inch, 225 horse-power electric-light plant 20 hours a day, using 30 arc lights and 1500 incandescent lights.

The elevator pumps are the Gordon & Maxwell make, compound, working under a pressure of 54 pounds to the square inch, and are in use 20 hours per day. The amount and cost of fuel used during the months of November, December and January are as follows: November, 1891, 330 tons of slack at a cost of $464; December, 1891, 337 tons of slack at a cost of $470; January, 1892, 4.0 tons of slack at a cost of $573.

Warming the entire building with a maximum pressure of 3 pounds (most of the time less than 1 pound), we think this is a very economical plant.

* Read at the Chicago Convention of the Master Steam and Hot-Water Fitters' Association of the United States.

Wasted Heat.*

BY H. W. HEATH, LYNN, MASS.

The province of the steam engineer to bring together the many products of nature, and to unite, change or separate them, has led to the display of much ingenuity, such as feed-water heaters, dampers, governors, regulators, pumps (complicated or otherwise), smoke consumers, patent settings for boilers, condensers, vacuum systems, exhaust heating, &c.

Nearly all of these appliances can be traced to some steam-fitter engineer, who saw that something better was needed, or a part of what was before considered a necessary waste could be saved, or made available in saving somethiog else. So much has been done in certain directions that it sometimes seems impossible to make a further saving.

LOSS OF HEAT FROM BOILERS.

The object of this paper is to point the attention of the present company to the heat contained in the products of combustion after leaving the boiler. A writer on the subject of heating makes this assertion, that scarcely 45 per cent. of the value of the coal is utilized, even in the best set boilers, and no less an authority than Prof. Elihu Thomson said recently in a lecture that in transmitting power by electricity, probably not more than 10 per cent. of the value of the coal was available. This coming from so high an authority in a company which uses many, if not all, of the modern steam-saving appliances gives weight to the thought that something can be gained by some appliances that can be attached between the boiler and the chimney. Two experiments of this kind have been made by the writer, both of them heating water: The first in connection with a hot-water heating plant, in which a small box trombone coil, consisting of four rows of 1-inch pipe, 24 pipes high and 3 feet long, was used, the water to be heated being introduced at the bottom and distributed to two radiators from the top, the hot gases entering a brick chamber surrounding the coils at the top and being carried to the chimney as direct as possible from the bottom at the opposite end from the point of entrance, the whole being a part of a system heated by a steel tubular boiler of the upright pattern, and it has been in use six years; an addition of two large rooms on the northeast side of the house being sufficiently heated by this device.

The other experiment of placing some 70 feet of 1¼-inch pipe in the flue from a nest of boilers gives such results as to justify the belief that steam engineers cannot afford to let this matter pass unnoticed for a very much longer time, yet, sufficient data have not been obtained in either of these cases to warrant placing them before you, other than to show that something can be gained in this manner, the exact amounts still being an uncertain quantity.

THE HEAT IN COAL.

If theoretically, 1 pound of coal contains from 13,000 to 14,000 thermal units, and 55 per cent. or 7000 to 7700 thermal units are lost, the most natural conclusion is that the excess of heat goes up the chimney and can be utilized in heating water; yet this is probably not true, as in most cases the temperature of the gases will be very little, if any, above the temperature of the steam. Let us suppose that the gases pass into the flue or chimney at a temperature of 400°, or slightly above the temperature of the steam in the boiler at 60 to 65 pounds pressure, or 307° to 312°, with a grate surface of 1 square foot, capable of burning 12 pounds of coal per hour; then we should be able to impart 4800° or units of heat to water, or some equally good conducting substance for every square foot of grate surface used, or enough to raise the temperature of about 25 cubic inches of water from

* Read at the Chicago convention of the Master Steam and Hot-Water Fitters' Association of the United States.

40° to 212° of sensible heat for every pound of coal burned.

In other words, 45 per cent. of the heat of the coal is transmitted through the iron of the boiler into the water, 25 to 30 per cent. is used in igniting new or fresh coal and burning itself, and 25 to 30 per cent. passes into the chimney as waste, or to maintain the draft, and 15 per cent. of the last 25 or 30 ought in some way to be utilized.

If we remember that 1½ square feet of heating surface in a feed-water heater using exhaust steam from an engine will raise the temperature of 1 cubic foot of water per hour from 40° to 210°, and, as the engine exhausts through the heater into the atmosphere, the temperature of the steam cannot exceed 320°, as was the result of a test made on a new heater about six years since, why may not some part of the hot gases passing into the atmosphere from one or more boilers be made available?

The writer of this paper desires to leave this question open at this point, trusting that future experiments and practice may demonstrate or evolve some points for future economy in the use of coal, by using the ideas herein suggested.

Early History of Wrought-Iron Gas Pipe.*

BY R. T. CRANE, CRANE COMPANY, CHICAGO.

The demand for wrought-iron pipe began with the invention of illuminating gas, but the introduction of illuminating gas at first was very slow in consequence of prejudice and want of appreciation of its importance. About the time of the invention of illuminating gas, which was in the latter part of the seventeenth century, the long war between England and France was drawing to a close. It had made a great demand for gun barrels, which were largely made at Wednesbury, England, and at its close it left a large amount of this stock on the market, which (there being no other demand for it) was used for the small gas tubes by screwing the small end of one tube into the large end of another. This supply apparently covered the demand for small tubes for some time and the larger ones were made in the same manner.

In order to understand the invention of gas-tube welding it is necessary to describe the welding of gun barrels. This consists of taking a properly prepared piece of iron of the right dimensions, drawing the edge down thin, heating it, then rounding it up until the edges lap one over another. In this form it is called "skelp." It is heated in a forge fire, a few inches at a time; then a bar of iron is put on the inside, to give support to the iron while it is being hammered down on the outside and the weld made. Then it will be seen that only a few inches could be welded at each heating of the iron, making the process a very slow one, and the barrel, when the welding was completed, was left in a very rough and unfinished state.

EARLY GAS TUBING.

It appears, from the best information we can get that about the year 1825, and in order to meet the largely increased demand for gas tubing it became evident that some better mode of manufacturing gas tubes should be sought for than the process of welding gun barrels. James Russell, in company with his brother John (who had been gun-barrel and gas-tube makers at Church Hill since 1811) appreciating this fact, set about making an improved gas tube. He concluded that it should be of a uniform thickness of iron, and also, as the pressure of gas was merely nominal, that there was no necessity of so strong a weld as that of the gun barrel. He conceived the idea, and patented it, of welding his tube by butting the edges of the iron together instead of lapping, as in the case of the gun barrel. This invention was a great step in advance of this art, and enabled him to make his tubes much more cheaply and rapidly, and also of vastly superior finish. Still, compared with a later process, a description of which will follow, this production was very slow, as he was obliged to heat and weld it only a few inches at a time, after the manner of welding gun barrels.

To make this gas tubing complete it was necessary to have a device for connecting pieces of pipe, as the method employed in the case of the gun barrels was not practicable in this case, the iron being of uniform thickness. He now invented the socket, which is a short piece of pipe with a thread on the inside to fit a corresponding thread on the outside of the gas tube, the pipe being screwed in each end of the socket, thus making any desired length of pipe. The effect of this improved process was to so cheapen and beautify the article as to greatly increase the demand for it, and it seems that the invention made a great sensation in England. But this particular process of manufacturing must have been very short lived, it being patented in January, 1825, since it was followed by the patent of Cornelius Whitehouse in February of the same year for butt-welding tubes by drawing them through a die. This method of welding tubes being brought to the attention of James Russell, he saw its importance, bought it and immediately proceeded to manufacture his tubes under this patent.

BUTT WELDING.

Mr. Russell recognized the principle of the strength of a circle—that is, when the iron for a tube is rounded up any amount of pressure may be brought to bear on the outside without danger of collapsing the iron, and this pressure was necessary to force the edges of the iron together in making the weld. His process of doing this was to heat a small piece of the iron, then place it between two semi-circular dies smaller than the iron which necessarily forced the edges together, thus making the weld.

To return to the Whitehouse patent, and to make clear the principles involved in it, it may be stated that he takes such dies as Russell used, makes one end of them bell-shaped and fits them in a pair of tongs. He then takes a piece of the rounded-up iron called "skelp" and puts about half its length in the furnace, heating it to the welding heat. The die is then pressed on the iron, and by means of an endless chain the iron is pulled through the die. The die being smaller than the iron crowds the edges together, thus making the weld.

The principle involved in the Whitehouse method consists in the manner of applying the pressure to produce the weld; that is, he produced it by drawing the iron through the die, and Russell by compressing the dies. So, to give proper credit for these advances in the art, it should be said that Russell is entitled to the credit of discovering that a tube with a butt-weld is sufficiently strong to stand all ordinary pressure, and that a sufficient pressure can be brought to bear upon the circle of the iron to produce the weld. Mr. Whitehouse is entitled to the credit of discovering that the pressure to produce the weld can be obtained by drawing it through the die, which is simply an improvement upon the principle that Mr. Russell discovered; yet it was an invention of very great importance, as it enabled him to make tubes a hundredfold more rapidly, and also of a superior weld and much longer. Strange to say, this process has never been improved upon, and is the one in universal use for the manufacture of the small tubes at the present time.

The result of the Russell and Whitehouse improvements is the production of an article of great utility and beauty at an exceedingly low cost.

As an evidence of the importance of the advanced process of Russell and Whitehouse it may be stated that they paid as much for welding the gas tubes under the gun barrel principle as the finished, vastly superior product, is being sold for to-day.

LAP-WELD TUBE MAKING.

The above mentioned events took place in the early days of gas engineering, and, while engineering was also being developed, steam it had not, up to this time, reached any great degree of magnitude. But now its importance began to be more particularly recognized in connection with the building of railroads and locomotives, and through the discovery by Stephenson of the tubular boiler. This created a demand for a larger and different line of tubes, for which the butt-weld was not adapted, as the tubes were required to be much larger, and stronger in the weld.

It was evident that the only way to produce an iron tube suitable for these demands was to make it with the lap-weld, as in the case of the gun barrel, and while it would have been possible to make lap-weld tubes of uniform thickness and moderate length by the methods employed in gun-barrel making, it is evident that the process would have been too slow and expensive in operation, and the product too limited in length to meet the demands of steam-engineering.

At this time—which must have been in the neighborhood of 1830 or 1835—the Messrs. Russell appeared to have appreciated the importance of manufacturing a new line of tubing, and set about making the machinery necessary for it. To accomplish this was quite a different task from that of producing the butt-weld tubing, as it called for the highest order of mechanical skill and ingenuity, and there is no doubt that it cost the Messrs. Russell a large amount of money in experimenting before they perfected their machinery. They must have met with untold difficulties and annoyances in perfecting the machinery and furnaces, which only persons who have gone through similar ordeals, though having the benefit of their experience to commence with, can appreciate. They were certainly men possessing extraordinary courage and perseverance to contend successfully with apparently insurmountable difficulties.

THE JONES PROCESS.

About this time, or a little later, Martin Jones commenced experimenting in the same line. He also encountered many difficulties, exhausting his own and his wife's fortune, and in order to save something from the wreck, placed his invention in the hands of a friend, who betrayed him, appropriating it to his own use, improved it by continued experiments and patented it in his own name. He then took into partnership with him two gentlemen of large means, named Lindsam and Bowers, of Birmingham, where they established their works and produced the tubes on a large scale, there appearing to be at once a great demand for them. It is said that this purloiner of the "Jones" idea received for it during many years more than $100,000 royalty annually.

The difference between this and the Russell process appears to be only that the Jones made use of four rolls in the welding machinery and the Russell only two. The firm of Lindsam & Bowers, who were working under the Jones idea, brought suit against Russell for infringement of their patent, which developed into a bitter contest, involving the expenditure of $2,500,000 and resulting in victory for the Russells.

MODERN LAP WELDING.

The process of lap-welding is as follows. The sheet of iron is rolled to the desired thickness, width and length. The edges are then scarfed, as in the case of the gun barrel. It is then drawn, while red hot, through a bell-shaped die, by means of an endless chain, which rounds it up and laps one edge over the other. The whole length is put in the furnace and heated to the welding heat, afterward pushed out of the furnace at the opposite end into grooved rolls of a size corresponding to the size of the pipe. The inside lap is supported by a ball attached to a long bar of iron which holds the ball in position in the roll. The ball and the iron and the groove of the roll all correspond, so that the roll exerts a sufficient pressure upon the iron and the ball to force the laps of the iron firmly together, thus producing the weld.

The entire process must be perfect in order to insure success; that is, the bending and lapping of the iron, the heating of the furnace and the adjustment of the rolls and balls must all receive the most scrupulous attention. This operation is one of the most beautiful in all the mechanical arts.

After the process of welding, the crude piece of pipe is passed through other rolls to give it the correct diameter, and again through others for the purpose of straightening it.

If the tubes are to be used in boilers they are only cut off the desired length and tested, being then ready for use. If the tubes are to be used for steam pipe, the ragged ends are cut off, screws cut on both ends and a socket put on one end. The tubes are then tested and are ready for the market.

Probably the production of no other line of goods has ever created such a sensation as this, and never were manufacturers so harassed by pirates in the trade as were the Russells. It is a satisfaction to know that they successfully combatted all oppression and were successful in maintaining their patent, and that finally success crowned their enterprise, invention, skill and perseverance. The firm conducted business for many years, through different combinations of the Russell family, under the name of the Crown Tube Works, Wednesbury, Eng-

* Read at the Chicago Convention of the Master Steam and Hot-Water Fitters' Association of the United States.

land. As to the magnitude of their business, it is stated that in 1824 they made but 3000 feet of tube, while in 1871 the number of feet supplied by the same firm reached the enormous figure of 6,700,000. This may give some idea of what the output must be of the 35 or 40 mills existing at the present day.

HEATING NOTES.

THE KOHLER FURNACE & STEAM HEATING COMPANY, 24 Union street, Boston, Mass., will remove about July 1 to 93 Union street, occupying the basement and street floors.

HERENDEEN MFG. COMPANY, Geneva, N. Y., have their exhibit at the World's Fair in working operation in the greenhouse annex to Horticultural Hall, four No. 8 Furman boilers doing the work. The plant was installed by the Chicago house, who endeavored to make it a model of greenhouse heating. The overhead flow and return under bench system is used.

W. H. WRIGHT, who is attending the exhibit of the Powers Duplex Regulator Company at the World's Fair, is showing visitors a new pipe wrench, for which he is taking out a patent. He claims that its simplicity, strength and efficiency make it the "Wright" one to buy.

THE AMERICA HOT-WATER HEATER COMPANY, formerly of Beloit, Wis., are now thoroughly installed in the "water power" at Rockford, Ill., and, under the efficient management and superintendence of G. A. Houston, are busily engaged in the production of their heater. A comprehensive catalogue of their new apparatus is now in preparation.

IN ADDITION to the well-known Plummer steam heater and Leader hot-water heater, the Putnam Foundry & Machine Company, Putnam, Conn., are putting on the market a new sectional boiler for steam or hot water. This apparatus is called the Putnam, and has capacity from 800 to 1500 feet of radiating surface. It has not as yet been shown to the trade at large, but a number of them are in operation in the locality. The plant of the Putnam Company has recently been largely re equipped, new engine, boiler and machinery having been added and a new building erected.

L. H. CHUBBUCK & CO., Boston, Mass., publish a catalogue describing hot-air furnaces, ranges, boilers, &c. The hot-air furnace is said to be made for use and abuse, its solidity, weight of material and durability being its particular features. The steam and hot-water heating apparatus made by this firm is a boiler consisting of vertical sections, comprising front, back and intermediate sections, all of which are connected by screw joints to secure safety from leaks, and it is further pointed out that all the connecting pipes can be removed and replaced without disturbing the brick work. The catalogue shows the forms of the different sections, and descriptive text explains very fully their special features.

RUSSELL WHEELER & SON, Utica, N. Y., issue a greeting to the trade in the shape of a pamphlet containing numerous testimonial letters showing what the Palace King boilers have done and are doing. Along with the circular is also a revised price-list for insertion in their hot-water catalogue. The pamphlet is of oblong shape and the testimonials are printed on thin paper on one side of the sheet only, each letter being neatly inclosed in a border, giving a pleasing effect. The testimonials refer to the record of the Palace King during the winters of 1890, '91 and '92.

WHETHER steam pipes will set fire to wood or not is, observes an English exchange, one of the questions which will never wear out. It seems clear that as long as no change occurs in the wood a steam pipe would scarcely set it on fire, as the temperature required to ignite wood is much higher than steam is commonly used at. But the danger lies in the fact that by continuous exposure and contact with the heated pipe the wood undergoes a slow but sure change in its condition, and becomes very little better than tinder. In that state, while it would perhaps not take fire from a steam pipe, a sudden rusting of the pipe might possibly generate enough heat to set fire, as is the case in rapid oxygenation of linseed oil, for instance, when mixed with waste or sawdust. But the danger from a pipe passing through a partition in plain sight would not seem to be imminent.

THE BELKNAP MFG. COMPANY, Bridgeport, Conn., issue a tasteful catalogue and price-list of brass goods for steam, gas and water, which they manufacture. The pamphlet is of convenient size and contains some 60 pages, bound in green paper, the front cover being decorated with a graceful scroll in gilt and the name of the Belknap Mfg. Company, together with a representation of a valve. The first goods noted in the catalogue are radiator valves of various sorts, check valves, elbows, air valves, &c. Then come globe valves and angle valves, straightway check valves, safety valves and other goods, followed by steam whistles, steam cocks, gauge cocks, water glasses, oil cups, unions, hose couplings, hose clamps and other goods. The whole is got up in a neat fashion and will be valued by the trade.

THE WILLIAM H. PAGE BOILER COMPANY, Norwich, Conn., favor us with a batch of circulars and other advertising matter that contain many points of interest in the steam and hot-water heating line. Two of the publications are small illustrated and descriptive circulars of the boilers made by this concern. One relates to the Volunteer in forms adapted both for steam and hot water. The apparatus is very thoroughly illustrated by means of sectional and other views, and complete descriptive text accompanies the cuts. An interesting heater shown in this book is the No. 1 Volunteer, which has only one section and is designed to be set up in a back shop for heating that room, and also a front or sales room by means of radiators. It can also be used for heating small cottages containing three or four rooms, as well as brooder houses for raising chickens. This boiler is adapted for work about which many inquiries are made. A similar circular to the one above mentioned illustrates the All Right boiler made by the same concern. The firm also issue little pamphlets of testimonial letters, as well as a *fac-simile* testimonial reprinted from the Norwalk *Gazette*.

The establishment of new cotton mills goes along at a merry rate in the South. *The Manufacturers' Record* says that the activity displayed in this direction during the past 12 months is unprecedented, and that if the number of new concerns continues to be augmented at the same ratio as in 1892 the present year will see a still greater development of the industry. From January 1 to June 1, this year, there have been formed in the Southern States 60 new cotton-mill companies, many of whom have the erection of their plant well under way, while a number are already in active operation.

Aspects of Trade in the Northwest.

From the Loyhed Tinware Mfg. Company of Seattle, Wash., we have received the following interesting information in regard to the present conditions and future prospects of trade in that section of the country. Writing under recent date, they say: Aside from the salmon packing, most of the other canners in this Pacific Northwest are just beginning, but so far have been uniformly prosperous, and their output is constantly increasing. This is particularly true in the line of canned fruits, for while California stands far ahead of us, there are many here who are starting in an exceedingly small way, and they are in the business to stay, because we grow many fruits of as fine quality and flavor as any other locality can possibly produce. Popular opinion in the East does not coincide with this, but facts must eventually overcome a mistaken idea, and the time is not remote when certain Washington fruits will be regarded as standard.

The spice trade is also doing well, because we are nearest the Pacific Islands that produce so many spices. Trade in general has not been for some time up to the standard of former years among the retailers, but the local jobbing trade has gained steadily for the past five years, which goes to show that the dullness has been caused more by overcrowding in the retail ranks than by a falling off in actual consumption. Our fisheries are being slowly developed—notably cod and halibut, which are paying extremely satisfactory returns to those who have invested in that industry. The competition arising from the building of the Great Northern, which now gives Puget Sound three transcontinental railroads, places it in a commanding position as regards freight rates, and the steady development of the coal and lumbering industry seems to indicate that we are to be a commercial people, not confined to one or two staples or to narrow lines.

While trade depression is general throughout the country, we do not believe it is as great in Washington as in many other places. Not all our Seattle banks are in the clearing house, but those that are have a capital of over $2,000,000. The last bank statement shows that their reserve was 40 per cent. in the average, which is sufficient argument as to their condition. While croakers here and in the East are gleefully prophesying a disastrous future for our corner of the United States, conservative business men are satisfied both as to the present and the future, and their opinion is entitled to weight.

The weather in the South has not been favorable for the cotton crop. The planting season opened much earlier than last year, but owing to the unfavorable weather the advantages gained have been generally lost and crop conditions at present are about on a par with those at this time last year. Taken as a whole, however, the prospects are somewhat better than they were a year ago.

STOVE TRADE NOTES.

Exhibits at the World's Fair.

Heating and Cooking Apparatus.

WROUGHT IRON RANGE COMPANY

of St. Louis make a very good display of their Home Comfort steel ranges. The pavilion is inclosed with a white and gold railing along two sides, the other two sides being solidly paneled to a ceiling which is laid off in panels of a geometrical outline. A conspicuously painted sign informs the passer-by that 258,460 Home Comfort ranges were sold up to January, 1893. The goods shown comprise a variety of the company's products, such as a double hotel range in natural steel finish, a charcoal broiler, a full nickeled family range, a 7-hole range with double oven for boarding house or restaurant, a plate warmer large enough to supply a 200 room hotel, a four-door sand oven for the purpose of cooking pastry or roasting meats; an egg boiler with four baskets and two and a half and three minute glasses; a combined steam table and carving table, used principally for keeping food warm, manufactured of 22 ounce copper instead of galvanized iron as has heretofore been customary; and a battery of urns for hotel and restaurant use, composed of a central urn, to be connected directly with a steam pipe, in which water is heated, which is syphoned as needed into a tea urn on the left and a coffee urn on the right, the whole outfit being handsomely nickel plated and resting on a polished Tennessee marble slab. The company had intended to make a very elaborate exhibit of their goods, expecting to get a space 36 by 82 feet, but were cut down to 10 by 11 feet, which was afterward increased to 11 by 25 feet, and on this contracted area they have managed to do very much better than was expected. A range was sold last week to the Commissioner-General of the United States of Colombia, to go to Bogota. It will have to be packed in three packages for carrying 200 miles on muleback. The visitors to this pavilion were favored with a miniature malleable cast skillet as a souvenir.

THE ROUND OAK STOVE WORKS,

owned by the Estate of P. D. Beckwith, at Dowagiac, Mich., have a space of only 11 x 15 feet, very much less than they should have for an adequate representation of their line. It affords merely room enough for a row of oak stoves round three sides, nine in all. A gold-plated oak stove will shortly be in position in front, work on it not having been completed at the time of the writer's visit. This stove is one of the company's standard stoves, No. 16. The beauty of the plating will attract attention. This establishment, as is well known, makes nothing but oak stoves, and makes them well. The display, therefore, lacks the variety of most stove exhibits, but is nevertheless interesting for this very fact. Heavy circular columns support a silk canopy for a ceiling. Large portraits in oil of Mr. Beckwith are on three sides of the top of the pavilion. An oak stove in flowers is to be a permanent feature of the exhibit.

THE BOON RANGE COMPANY

of Cleveland and Galion, Ohio, have evidently not yet completed their arrangements. They have a row of steel plate wrought ranges, consisting of a six-hole range with incloased hot-water reservoir and elevated hot closet; a six-hole range with charcoal broiler and elevated hot closet; a plain six-hole range with elevated hot closet and a four-hole gas range with elevated hot closet. The oven doors in these ranges are made to drop, but they are then firmly supported by hinged brackets, which automatically fall into place, giving very rigid support. The hot closets have revolving doors, lifting up from the bottom, opening the whole interior at once.

A. A. GRIFFING IRON COMPANY

of Jersey City, N. J., have managed to make a very creditable exhibit in rather cramped quarters. As a background they built a rack of heavy lumber with three shelves, covering the whole with black cloth. Radiator loops and valves in graded sizes occupy the extreme top; small radiators, in square patterns principally, flanked by cans of Bundy radiator enamel, come on the next shelf below; a glass case of samples of Bundy Bavarian bronze powder has the central position on the next shelf, with radiator loops, radiator feet and radiator fittings in graded sizes on the left, and three and four flued ornamental patterns on the right, with valves and other fittings strewn about. Nickel-plated escape cocks decorate the fronts of the shelves. The floor space is then devoted to a varied assortment of radiators, embracing square loops with roughened surfaces, oval-topped, floral-topped, beaded-topped, plate-warmers, corner radiators, circular radiators, &c. The

S. B. TRAUB RANGE COMPANY,

manufacturers of the World's Best steel ranges, 435 State street, Chicago, show a large double oven French range, with some notable special features. The fire box is rectangular, with revolving grate bars, each operated separately. The feed door is made with diamond-shaped sides, overhanging the lower part of the supporting extension, so that when open the sides are brought firmly in contact with the front of the range, the lid thus making a straight chute or feed pouch into the fire box. The ovens are furnished with tile bottoms, finished in a pleasing design, while the drop oven doors are not only supported by an automatic bracket but also have a stiff spring to assist the closing of the door in place of a counterbalance. A charcoal broiler is also shown.

EDWIN A. JACKSON & BRO.,

50 Beekman street, New York, make an excellent display of their heat-saving and ventilating grates. One of them is shown set on an elevated platform, so that the method of admitting air from below can be demonstrated. Others are exhibited in tile setting, with tiled hearths, just as they would be placed in living rooms. Unmounted castings are also shown of the ventilating grate and the combined grate and furnace, intended for heating more than one room.

THE HUETTE-BARLER MFG. COMPANY

of Chicago make a very showy display of Barler's Ideal oil heater. The space used is small but judiciously handled. The company's name in raised gold letters on a black velvet atrip appears on a light blue background, forming a rear wall. In front are two rows of stoves, some in plain sheet iron, some in full nickel and one in full brass. Barler's roller base is shown in various styles of finish, and also Barler's shoe-blacking outfit. A convenient post enables a couple of oil heaters to be placed on high on brackets, attracting more attention.

KELSEY FURNACE COMPANY

of Syracuse, N. Y., exhibit Kelsey's corrugated furnace, the display being devoted exclusively to warm-air and hot-air heating. For the purpose of more thoroughly explaining the construction of this furnace to visitors a section of the side of one has been cut out. The principle upon which the furnace is constructed is that of bringing the air through numerous flues in as close and continuous contact with the heat of the fire as possible. For this purpose vertical flues are used, cast with corrugated sides, placed round the combustion chamber. The flues, are almost V-shaped in cross section, so as to stand closely together in the circle. The upper parts of the flues overhang the combustion chamber somewhat. The lower interior parts of the flues form the combustion chamber or fire pot. The amount of heating surface secured by the corrugated flues is evidently much greater than in ordinary constructions, while the flues can, if desired, be coupled directly to pipes leading to separate rooms, so as to force the distribution of heat. Ordinarily the heated air is accumulated in the common air chamber at the top of the furnace and sent thence to different rooms. Several sizes of this furnace are shown, one being finished with a planished iron jacket.

EDWARDS PARLOR LAMP STOVE COMPANY

of Chicago show a number of varieties of their lamp stoves. Among them is a double heater, having two lamps, one on each side of a frame having a top with two cooking holes. When not used for cooking, the top is covered by a lid with holes for the escape of heated air. It is claimed that this heater will warm a room 30 feet square, 10 feet high. Lamp stoves for barbers' use, student lamps for heating and lighting at the same time, and other lamp stoves for heating ordinary living rooms are shown. These lamps can be taken from below the circulating stand and set on top of it, thus forming a piano lamp.

JAMES STROUD,

1263 Broadway and 529 Sixth avenue, New York, exhibits Stroud's self-basting roasting pan. There are two pans used for this purpose. The lower one is partly filled with water, from which steam arises, passing through holes in the sides of the upper pan, thus doing the basting automatically which is usually done by hand. The upper pan is made of steel, full enameled in blue and white. Corrugations on the bottom of the pan enable the contents to be surrounded by hot air for browning, while a depressed bowl collects the gravy in one corner of the pan.

THE NORTHWESTERN STOVE REPAIR COMPANY,

Chicago, who make repairs for 70,000 stoves and ranges, show a large assortment of parts of stoves, indicating what they are prepared to supply to their customers. Fire pots are built up in pyramids, running from very large ones at the bottom to very small ones at the top. Range fire pots are shown on racks built step fashion. A huge frame decked with scarlet cloth stands as a background to the exhibit, covered with flat parts of stoves.

THE LAURA NEVINS RANGE & HEATING COMPANY

of St. Paul, Minn., exhibit three of their curiously shaped Laura Nevins ranges. These ranges are construced with a circular front and a square extension in the rear. In the center of the front part is a circular fire pot surrounded by cooking holes. The rear contains two ovens. A duct, opening at the floor, supplies air to the range, which can thus also be used to heat other rooms.

DANGLER STOVES AND RANGES.

A glittering sign advises, "Use the Dangler Gas and Vapor Stoves," over a display of the Housekeepers' Delight and Volunteer vapor stoves made by the Dangler Stove and Mfg. Company of Cleveland, Ohio, and sold by D. S. Cook, Chicago. The steel tops and trays are finely japanned and ornamented with flower designs and landscapes, the frames being handsomely nickel plated. The burners are of the needle-valve character, provided with a stop to prevent damage by unskillful operation, and the air mixer has a governor. This display is a very fine one, showing all the varieties of stoves made by the company, and fully illustrating the high state of development reached by the gas and gasoline stove trades at this date.

THE TUTTLE & BAILEY MFG. COMPANY,

New York, by the combination of a triangle and a diamond, form a column with many sides for the display of their registers. It is finished in white, with gilt trimmings, having a ground of garnet silk plush. The registers for heating and ventilating make an attractive show, finished in gold, silver, various tints of bronze and black and white enamel. Of the designs used some are massive and elegant, while others are delicate and beautiful.

THE J. F. PEASE FURNACE COMPANY of Syracuse, N. Y., have recently made a contract with the Onondaga Dynamo Company for the installation of a complete electric lighting outfit, which will take the place of some apparatus which was installed in the company's foundry when the building was erected in 1887. A complete electric lighting plant is also to be installed in the company's works on Willow street.

The Manufacturer and the Jobber.

BY EUGENE W. BELSON, PHILADELPHIA.

The question is often asked whether it is more profitable to engage in the manufacture of stoves or to become a jobber.

At the first glance this question appears to the average reader one of very easy solution, with the advantage, if any, greatly in favor of the manufacturer; but to be as brief as possible without going deeply into figures, the writer, who has had some experience in both branches (from a financial point of view) is inclined to favor the jobber, for the following reasons: In the manufacture of stoves, with its large amount of invested capital, from the erection of the plant, its completion and in complete running order, the manufacturer's life is anything but rosy. His associates must be men of thorough practical knowledge, sound judgment and good readers of human nature.

The necessity of keeping in stock a large assortment of his product, in and out of season, ready at a moment's notice to meet the demands of the dealer, requires large amounts of capital, which is practically sunk until fall. He at times (not always) relies on the suggestions made by his traveling men for such alterations and improvements in patterns which from their observation and judgment are warranted. He is, or should be, careful not to sell directly or indirectly to the consumer, else the dealer stigmatizes him as a robber. In fact, a thousand and one complaints and annoyances fall to his lot, which require judgment, skill and tact to surmount. But aside from the above facts, the manufacturer is supposed to have sufficient safeguards thrown around him by his association, which fixes and regulates his prices to meet all necessary requirements, yet from the very formation of his association it has been known to be unstable. Outside competition, no doubt, is an important factor in the above complication, but it can undoubtedly be traced to self-interested zeal among the different members themselves rather than to any outside influence. The position of the manufacturer appears to be getting more and more uncertain. It is quite noticeable to the jobber that the tendency of the manufacturer is to enter into competition, noticeably in gasoline, oil and gas stoves, thus showing a want of stability in the manufacture of his own product.

But the jobber, outside of his original investment, situated as he is with an open market from which to select his numerous wares, has none of the above obstacles to contend with. His judgment in the selection of marketable goods must be broad and liberal, a man of far-reaching capability, quick to grasp and hold a good thing when he sees it. It must be borne in mind that it is an utter impossibility for the jobber to handle with profit stoves exclusively. In the selling of stoves, side lines form an important adjunct. They are, in fact, the bulwarks of his business, for what he loses on one he gains on another. Besides, he has four seasons in which to dispose of his wares, whereas the stove manufacturer has only one. His stock must be kept constantly replenished, for in this, one of the most important essentials, rests his success. With his various and unlimited resources at command, his position when placed as an antagonist to the manufacturer becomes formidable. His position in the market becomes more tenable in proportion to any weakness displayed by any association or combination. There should be the utmost reciprocation, as far as mutual interests are concerned, and closer ties binding manufacturer and jobber for mutual benefit.

A Degreeless Doctor.

It was several years ago that the title M.D. was conferred upon E. B. Doolittle of the Richardson & Boynton Company, and it came about in this fashion. On one of his autumnal trips, Mr. Doolittle struck the town of Salem, N. J., and was invited by a hospitable dealer to attend the Woodstown Fair, which is one of the best of the annual agricultural exhibitions and is famed throughout that end of the State. People come for miles around to view the prize cattle and gaze with wonder on the woolly pig, the hairless dog, two-headed calves, &c., and to participate in three-shots for-five-cents or the wheel of fortune, and sometimes to investigate the mysteries of a little entertainment called the plate game. Added to the other attractions that go to make up a county fair, there was the usual horse trot, in which old Bill Brown's gray mare led all competitors in the event for 16-year-olds. Perhaps it was during the crush to see the finish of this heat that the accident occurred which brought our friend Doolittle into prominence. Going back a little in the narrative it is necessary to state that the host of the occasion was somewhat of a wag, and on their arrival at the grounds Doolittle was introduced to a number of ladies and gentlemen as Dr. Doolittle from Mt. Vernon, N. Y., and the title was let pass without contradiction as one of the host's jokes. However, this was a fatal mistake, as subsequent events prove, and, as we said before, it was probably during the excitement attending the victory of the gray mare, that a man had a fit and everybody rushed to render assistance and every other body called for a doctor, whereupon one of the ladies who had been introduced to Dr. Doolittle spied him in the crowd and sent her husband for him post haste, at the same time assuring the crowd that everything would be all right, as her husband had gone after a physician, who would be there in a few seconds. By this time Doolittle had gotten wind of his predicament and had turned heel to, with toes pointed toward the refreshment tent, whither he directed his steps with vehemence. It was no use, for the messenger sent caught up with him and insisted upon his returning to render professional services to the unfortunate individual in the center of the crowd. Doolittle endeavored to explain the joke and protested that his degree was not regular and that his specialty was not fits. In the meantime he had been hurried against his will toward the crowd and with each step nearer the patient he was growing more excited, all the time endeavoring to explain to his captor the true situation. Just here is where Doolittle's great luck stood him in good stead, for as he reached the point where it was do something or run, the crowd fell back and disclosed the sufferer pulling himself together and rising to his feet completely recovered. Our physician here breathed a suppressed sigh of relief, and put up a large and elegant bluff, feeling the patient's pulse and assuring the crowd

that he would be all right if he kept out of the hot sun and avoided excitement. Refusing a fee and retiring gracefully, Doolittle started off on a search for the man who had unconsciously gotten him into such a scrape. What passed between them is not reported, but it is known that Dr. Doolittle and party soon left the grounds and after a visit to the hotel drove away in the direction of Salem. In that part of the country he still has fame as a specialist on fits.

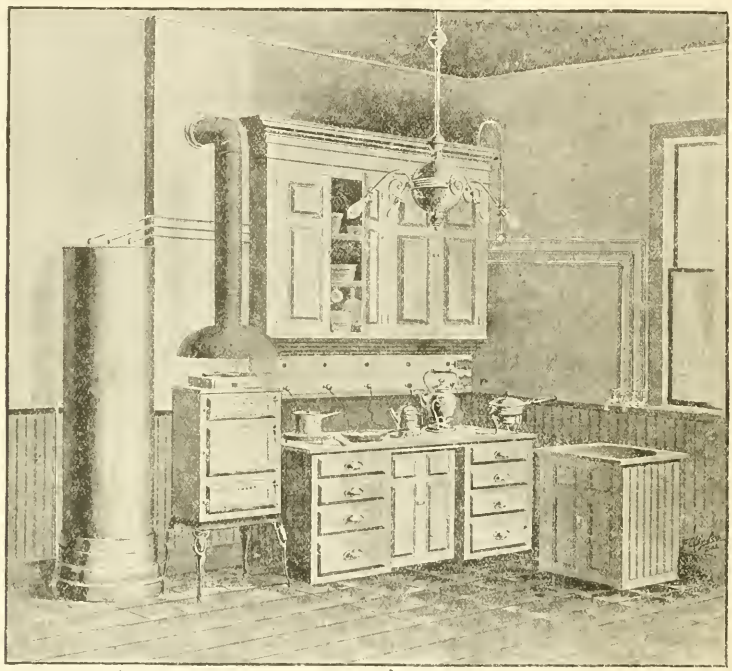
Rathbone, Sard & Co.

A substantially bound and well-arranged stove catalogue, covering an extensive line of specialties, is that which has recently been issued from the press by Rathbone, Sard & Co. of Albany, N. Y. It is a volume of 156 pages, printed in black ink upon a good quality of calendered paper, and bound in flexible covers of red, carrying side titles in silver. The corners of the pages are rounded and the edges finished in bright red, giving to the volume a rich and finished appearance. The opening pages are devoted to a statement of terms, some remarks about Acorn free advertising material, a comprehensive index, views of the company's foundries at Albany, N. Y., and Aurora, Ill., and of their warehouses in Albany and Chicago. Sectional views of stoves are given, showing the system of oven ventilation employed, and also the fire box of the National Acorn range, which has proved very popular with the trade. The line of ranges shown are made under the generic name Acorn, with such prefixes as National, Magnet, Puritan, Penn, Duplex, Pacific, King, Prince, &c. We also notice the Eureka, Senator, Citizen and Home ranges, made in various sizes and the usual styles. The cook stoves embrace a large assortment and are offered under such names as the Iron, Live, Regal and Beech Acorns. The heaters are illustrated and described in the closing portion of the catalogue, the leading place being occupied by the Art Westminster, well known to the trade. The Acorn Art Parlor, a handsome construction made in two sizes for hard coal; the Royal Acorn of graceful proportions; the Princess Acorn for hard coal; the Mohawk base burner; the Eastern Acorn, an attractive, revertible flue surface burner; the Square Oak Acorn, made in several styles and sizes; the Glen Oak, a new low-priced heater of attractive appearance; the Floral Acorn, a cottage parlor stove for wood, and an interesting line of Todd box and cylinder stoves, are among the other constructions to which attention is invited. One page is devoted to the Tropic Vapor stove, provided with removable cartridge in the stand pipe, and in connection with which a price-list is given of Junior stoves and ovens. The catalogue is neatly gotten up and carefully arranged with a view to meeting the requirements of the trade.

WE UNDERSTAND that the Detroit Stove Works have purchased a strip of land fronting 200 feet on the east side of La Salle street, south of Twenty-ninth street, in Chicago, for the purpose of erecting thereon a five-story warehouse of brick and stone. The building will cover an area of 200 x 112 feet in size, and is estimated to cost about $50,000.

Heating and Cooking by Electricity.

The American Electric Heating Corporation of 274 Purchase street, Boston, Mass., have recently brought to the attention of the public a number of electrical appliances for heating and cooking purposes. A few of the applications of electricity for the purposes named are illustrated in the engravings presented herewith. Fig. 1 represents a model kitchen, fitted with boiler, roasting and baking oven and various cooking utensils, the heat for which is supplied by electrical currents; Fig. 2 represents what is known as a plate stove, while Fig. 3 is a coil heater. The ovens, hot-water circulating boiler, and some of the other continuously operated apparatus are so constructed that "the temperature can be varied within wide limits without the use of exterior resistance." In referring to the electrical oven the makers state that the heat, which is largely radiant and of great intensity, is produced evenly all around the oven, the effect being so perfectly uniform that it is unnecessary to baste the meat or turn the bread or cake while cooking. The electrical broiler is so constructed as to meet the requirements of the case, and it is claimed that steaks and chops can be cooked in the usual time with entire satisfaction. All the apparatus made by this concern are constructed for operation on either direct or alternate circuits having a potential of from 25 to 118 volts, with the exception of that for heating air. Electricity is also employed in connection with a variety of apparatus for industrial purposes, such as soldering irons, tailors', dressmakers' and hatters' use, &c.



Heating and Cooking by Electricity.—Fig. 1.—Kitchen Fitted with Electrical Appliances.

The system of electric heating for street cars which is being introduced by the American Electric Heating Corporation consists of a generator divided into heat and chemical chambers, to

Fig. 2.—An Electric Plate Stove.

which is attached a coil of pipe for supply and return, which is screwed on the front of the riser in the seat. In this electrical apparatus is a coil composed of an alloy of high resistance, and having a high fusing point. This coil is placed within a compound which stores the heat for a long period. The heat generated in the heating chambers is absorbed by the chemical solution that fills the generator and is transmitted through the pipes, that present large area of radiation. Thus by circu-

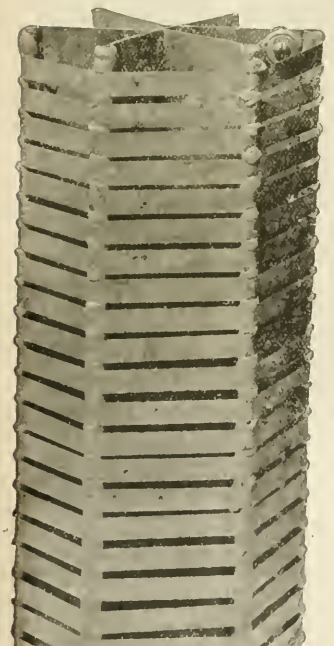


Fig. 3.—Coil Heater.

lation the chemical parts with its heat in the car, returning to the generator as it cools, to be again charged with thermal units, and once more diffused into the car. The makers claim that the use of this apparatus results in a uniform temperature throughout the car, which is comfortable, despite the steady influx of cold air incident to the constant opening of the door. The running expense of the system is said to vary in each locality, being governed by the price of coal and the efficiency of mechanical and electrical apparatus employed in conversion.

Traveling Salesmen.

We have before us a letter from an enterprising dealer in the Empire State who discusses some of the points touched upon by C. S. Prizer in his paper read before the stove manufacturers at their recent convention at Chicago. Among other things he says:

I have been much interested in Mr. Prizer's article published in *The Metal Worker* of June 10 entitled "Traveling Salesmen." My interest is not so much on account of the salesmen as it is in that portion of the article under the head of "Marketing Goods," and from there on to the end. Mr. Prizer says that general savings cannot increase general profits because of general competition. He also says that interest and profits rise and fall together. Inasmuch as profits are simply wages contingent instead of wages fixed, he might have gone further and stated the fact that interest and wages of all kinds have, on the whole, declined together. He says also, that too much productive ability is not possible while there exists a class of human beings whose wants are not supplied. Does he not see the cause of this strong competition for business or work. It stares him in the face. It is plain to whoever will look for it. Competition for work tends to decrease wages—competition for business tends to decrease profits. Competition of capital for a chance to use it tends to decrease interest. No work can be done, no business can be carried on, no capital can be created or used, without the natural raw material to use, which material cannot be made by men, but which is furnished to mankind free of charge by the Creator.

But this material under our infernal system of private ownership of land is absolutely controlled by a part of the people, and the same competition which decreases wages, profits and interest, increases the price of natural materials. Just as land values go up so must wages, profits and interest go down. The more capital and labor must pay for materials the less there will be left for capital and labor to divide between them. When a part of the people are allowed to own and control all the raw materials out of which all the people must get their living, that part of the people will own all the rest. Great fortunes will grow up without work, while the laborers will barely get a living. They who own the land need do no work, while those who have no land must work for both; and just as inventions and discoveries increase the demand for material so do they decrease the demand for labor. If the total wealth be expressed by $1, it is plain that capital and labor can have only what is left after the landowner is paid. If the ground rent is 40, the rest can be only 60. Now, if this private ownership of the people's means of living is right there is nothing to be done, but if it is wrong let us look into it and see whether or not a better way can be found.

New Works of the Joseph Bell Stove & Range Company.

The Joseph Bell Stove & Range Company commenced operations in their new works at Muncie, Ind., on Wednesday, May 31, with about 40 hands in the molding department. The buildings are of brick, constructed in a substantial manner and conveniently arranged. The foundry is 145 x 135 feet in size and has a capacity for 100 hands. There are two cupolas—one of 20 tons and the other of 4. The cleaning and mounting rooms occupy a building 200 x 60 feet in size, 2 stories in hight. In this structure is to be located the steel range, nickel plating and japanning departments. A 100 horse-power engine, with boiler, furnishes the motive power. The building is constructed in such a way that it can be readily extended at any time. The patterns are to be stored in a fire-proof room 60 x 60 feet, which will be erected as soon as possible. The entire plant is equipped with the latest improved machinery and appliances, and furnished with a complete system of gas, sewerage and water mains. The ground occupied includes about seven acres, upon which is located the company's gas well. A handsome and spacious office is now in process of erection, and which, when completed, will be two stories in hight. The second floor will be fitted up as a sample room, in which will be the office of T. E. Silky, who will have charge of the salesmen. We understand that the company will add a number of new patterns to their already extensive assortment. Owing to some delay in receiving machinery and material, it will probably be a short time before all departments are in running order, but work will be pushed forward as rapidly as possible until the plant is ready for operation to its fullest capacity.

The officers of the company are Joseph Bell, president; J. D. William, secretary; D. Walter Bell, general manager; and E. A. Dufrene, head bookkeeper.

ODD PLATES.

The Culter & Proctor Stove Company of Peoria, Ill., are the assignees of a patent recently granted to John E. Hunter of that place for a heating stove, in which is provided a draft at the top and which is delivered beneath a grated bottom adapted to be opened for the purpose of allowing the draft to pass through it into the fire, or to be closed to cause the draft to pass from the fire chamber above the grate directly into the smoke pipe. The top plate has one or more openings to receive vessels for heating water or other purposes, as may be desired. This top plate has a register for controling the draft. A swinging cover is provided for the top plate, and this cover has an opening coincident with the register

slide to afford access to the latter and allow free entrance for the air to the diving flue. This swinging cover provides a hot-air chamber, and from it the hot air passes into the draft flue.

A. Kohler & Co., 85 Union street, Boston, Mass., have issued a pamphlet of 14 pages, bound in colored paper covers relative to the Kohler hot-air furnace. This construction is illustrated by several engravings and described in a manner which makes clear the several features of merit claimed for it. Reference is made to the wrought iron of which the radiator is made, and to the heavy cast-iron fire pot, which is one of the features emphasized by the manufacturers. Attention is also invited to the Roxbury furnace, a low priced construction, having heavy steel radiator, cast-iron fire pot, shaking and dumping grate, cold-air box attached to the back of the casings at the bottom of the galvanized iron to receive the wood box, thus saving the expense of a cold air pit and to the capacious receptacle for the ashes. Some of the other pages are devoted to the Highland Grand and Prize Highland ranges, and to a long list of testimonials from many who have used the company's goods. Another feature of the pamphlet is tables giving dimensions of the Kohler and Roxbury furnaces and directions for using the heaters.

The Indianapolis Stove Company of Indianapolis, Ind., have been making some slight additions to their foundry with a view to increasing their facilities.

The Van Wie Gas Stove Company, Rockford, Ill., are having a demand for their No. 1 and No. 2 Eclipse ranges, which surpasses anything ever experienced by this company. It is pointed out that the fact that this stove is positively odorless does away entirely with the necessity of flues for carrying away disagreeable odors.

Anton Weiskittel of the firm of A. Weiskittel & Son, Baltimore, Md., is the patentee of a burner intended for use in connection with gas stoves. The device consists of an annular cup or receiver, having an open central air space, and provided at the upper edges of the inner sides of its walls with outwardly flaring beveled surfaces, forming a concaved seat. The annular top has, on its under side, inner tapering beveled surfaces fitted to the beveled bearings of the cup. The beveled surfaces of the top are provided with radial grooves running to its edges, and arranged alternately with the grooves in the under side. By this means the top is simply held in place by gravity, and all separate fastening devices are dispensed with.

Wood, Bishop & Co., of Bangor, Maine, have just brought out a combination hot-air and hot-water heater in six sizes. It is known as the Etna, and is referred to as being simple in construction and effective in operation. The fire pot is made in two parts, the upper half being hollow, forming the waterway. The water enters at one side, passes all around the fire pot, becoming highly heated in its passage, and then goes to the radiators, after which it is again returned to the fire pot, being heated to a higher temperature each time it returns. The makers state that with this combination rooms at any distance can be thoroughly warmed with hot water and the living rooms with fresh warm air, as the supply of cold air from the outside enters at the bottom and rising above the combustion chamber becomes thoroughly heated before being discharged into the hot-air pipes leading to the several rooms.

The Union Heating Company is the title of a new concern recently established at 92 Union street, Boston, Mass., for the purpose of transacting a general business in the sale of modern heating apparatus and the execution of all kinds of sheet metal work to order. They state that they have secured the general agency for the Superior warm-air furnaces, combination steam and hot-water heaters, as manufactured by the Superior Furnace Company. The superintendent and heating engineer is Walter E. Lyons, formerly with the J. F. Pease Furnace Company, and he will have direct supervision of the mechanical department. The company state that their equipment and facilities are first-class, and they are prepared to submit estimates, close contracts, and execute work in a first-class manner.

The Carton Furnace Company of Utica, N. Y., have just purchased the property adjoining their present plant, which will enable them to increase their productive capacity at least 25 per cent., this being the expected growth of their business this year. The City Council of Utica, on account of the company now owning the entire north frontage of the street, have changed the name of the thoroughfare on which the plant is located from Rome street to Carton avenue. The company state that the outlook for business is gratifying, and that up to the present time this year the sales of the Carton heaters are ahead of any previous year, the increase being largely due to the popularity of the goods which they are offering to the trade.

The J. F. Pease Furnace Company of Syracuse, N. Y., have recently finished the installation of their exhibit at the World's Fair and organized their office force. The exhibit is the object of a great deal of attention on the part of visitors, many friends of the company calling upon them daily. They state that they have already booked a large number of earnest inquiries from France, Germany, Italy and even Norway, while the inquiry from Americans who are either contemplating building or making changes in their heating apparatus are numerous. The company are much gratified with the results thus far obtained and consider their exhibit an excellent advertising medium. E. C. Moses, assistant secretary of the company, had charge of the installation of the exhibit and F. A. Tyler, heating engineer, is now in charge. We understand that W. K. West, assistant treasurer of the company, will be in charge of the exhibit during July.

Among the advertising novelties which are being distributed by the Michigan Stove Company is a pocket memorandum book of the general character which has become so popular with industrial establishments for advertising purposes. In addition to the pages for memoranda, we find tables giving the population of the cities of the United States and of the world, together with rates of domestic and foreign postage, and information likely to be found of interest to those visiting the city of Chicago. A yearly calendar for portions of 1893 and 1894 is a feature. Another novelty which the company are distributing is a card on one side of which is a reference to the Garland stoves and ranges, the statement being made that these are the only goods of their kind in which aluminum is mixed with the iron. This mixture, it is said, adds strength and prevents cracking. Reference is also made to the aërated ovens with which the goods are fitted. Still another scheme of advertising the Garland line of stoves is a prescription issued by "Doctor Experience," and reading as follows: "For tired feeling, induced by too hard work to sell goods, take up Garlands as a line with brains and push. Repeat daily until prosperity is no longer bearable. To be taken and tested before shaking."

James Morrison of Troy died on June 11, after having been an invalid for about seven years. He was born in 1812 in the north of Ireland, of Scotch Presbyterian parentage, and came to Troy with his parents in 1819. In 1835 he entered the grocery and lumber business as a member of the firm of Anthony, Morrison & Landon. In 1847 the firm was dissolved, and he engaged in the manufacture of stoves on Green Island. He continued alone for a number of years, and in 1854 the firm of Fuller, Warren & Morrison, now the Fuller & Warren Company, was formed. In 1860 Mr. Morrison resumed the manufacture of stoves on his own account, and in the following year the firm of Morrison & Colwell was formed, the business being carried on at Green Island. In 1865 the firm of Morrison, Colwell & Page was formed and a rolling mill was established in Cohoes. The firm has been continued ever since, Mr. Morrison's associates being Thomas Colwell and E. N. Page. A few years later the firm abandoned the manufacture of stoves, the members devoting their entire attention to the rolling mill industry. In 1876 Mr. Morrison became a member of the firm of Curtis & Co. of Cohoes, iron-pipe manufacturers. He severed his relations with this firm last January. In 1885 the Syracuse Tube Company was organized, to manufacture boiler tubes, Mr. Morrison becoming the president and one of the principal stockholders. He continued his connection with this company to the time of his death.

Grange Sard, vice-president of Rathbone, Sard & Co., is in Chicago attending the Columbian Exposition. His family are enjoying the trip with him.

Secretary Edward Bowditch of Rathbone, Sard & Co., Albany, spent the latter part of May in the Adirondack Mountains on a fishing tour. It is understood that he was very successful as a Waltonian.

The cultivation of beans and peas on cotton lands which have been overcropped is strongly urged on Southern farmers. Numerous varieties of these esculents are raised in India, China and Japan, which, apart from their edible uses, have other valuable properties, yielding oil and starch, while the stalks make an excellent fodder for cattle. These crops require little care, and some of them will grow on the poorest and sandiest soil.

According to a report recently issued by the Texas Agricultural Experiment Station, the cost of raising cotton in the Lone Star State is considerably less than 6 cents a pound. The cost in Georgia is 7.06 cents, so that the report is very flattering to Texas. It is further claimed that cotton can be grown in that State at less than 5 cents a pound.

Prize Competitions

$25.00.

As announced in previous issues the following competitions are now before our readers and remain open until the dates named:

Prize Competition No. 25.

SUBJECT:

Show-Window Display.

The subject of attractive show-window display is one requiring careful attention as an inexpensive and sure method of attracting and securing trade. This competition is designed to draw out suggestions as to the best methods of displaying goods, which may, if desirable, be illustrated by sketches and photographs. Prominent among the points which may be touched upon are the following:

1. The object of window display;
2. How this object may best be accomplished;
3. Kinds of goods especially suitable for window display;
4. The frequency with which displays should be changed;
5. Treatment of season goods;
6. To what extent goods in operation may be shown;
7. Suggestions for special and unique designs;
8. Arrangement of stands, shelving, &c., in windows;
9. Errors to be avoided in window display.

This competition will remain open until June 24, 1893.

Prize Competition No. 26.

SUBJECT:

To What Extent Are Manufacturers and Jobbers Justified in Selling to Consumers.

This competition is suggested by the fact that frequent complaints are made that manufacturers and jobbers interfere with the retailer's business by selling to his customers. It is intended to draw out the views of the trade on the subject. In discussing the question the following points may, perhaps, naturally be touched upon:

The annoyance and injury to which the retailer is thus subjected;

What the rights and privileges of the manufacturers and jobbers are in this matter;

What it is feasible for retailers to do for their own protection.

This competition will remain open until July 1, 1893.

Prize Competition No. 27.

SUBJECT:

Local Associations of Merchants.

It has been found feasible to form associations in many places for the purpose of securing more friendly relations among competitors and reaching an understanding in regard to matters of common interest. Among the good results referred to as coming from such associations are the following: Overcoming petty jealousies; cultivating a spirit of fraternity; listing of undesirable customers; an understanding in regard to time of presenting bills; putting in operation early-closing movements; agreement as to the prices at which goods are to be sold; mutual accommodation in supplying goods which one merchant may be temporarily short of, &c. The subject is thus evidently a broad one and of a good deal of practical interest. In discussing it the following points are suggested:

Whether it is desirable to have such associations;

How such associations may be organized;

The objects to be accomplished by them.

It will also be of interest to have any information in regard to the practical working of such associations.

This competition will remain open until July 8, 1893.

The following prizes will be awarded in each competition:

First prize.....	$12.50
Second prize.....	7.50
Third prize.....	5.00

The prizes will be awarded for answers which, in the judgment of the Committee of Award, are most suitable for publication and of the most general interest

We reserve the privilege of extending the time on any competition in case the contributions received are not of sufficient number or merit for the committee to award prizes. These competitions are open to every one, and it is hoped that there will be a general response from business men. We shall have the privilege of publishing any or all of the contributions received.

Replies are to be received not later than the dates on which the competitions close. They should be addressed as follows:

DAVID WILLIAMS,
96-102 Reade street,
New York.
Prize Competition No. —.

The committee to whom the contributions in Prize Competition No. 14 were referred have awarded the prizes as follows:

First Prize to WM. TODD, JR., Norristown, Pa.

Second Prize to E. T. BRADLEY, Swanton, Vt.

Third Prize to W. O. JACOBS, Danielsonville, Conn.

Australian Resources.

Australia, with her difficulties and disasters, has of late come into considerable prominence of an unenviable sort. The financial mire in which the country is now struggling seems to be ever thickening and deepening. Almost every day brings fresh news of bank crashes, involving industrial and commercial ruin and embarrassment there, and it is difficult to see what the outcome of it all will be. Yet few people in the United States are probably aware of the magnitude and of the immense natural wealth and resources of that great island continent. To many it may be surprising to learn that Australia possesses an area somewhat larger than that of the entire United States, exclusive of Alaska. Yet this vast territory is, for the most part, unpopulated and to a large extent unexplored. The whole Continent contains a population only about as large as the aggregated populations of New York, Chicago and Philadelphia. And more than half of the 4,000,000 of souls, or thereabouts, living in Australia are coogregated in half a dozen cities on the coast. Indeed, the populated and cultivated portion of the country comprises little more than a fringe round certain parts of the coast line. By far the greater part of the interior is wilderness or "bush." The primeval forests in many regions are rich in valuable timber. Yet their silence is unbroken by the ring of the woodman's axe. "No amount of word-painting or piling up of statistics can give even a faint idea of the vast potential wealth of Australia," says a recent writer, Edmund Mitchell, in the *Engineering Magazine.* He adds that there is an area equal to an English county for every man, woman and child in Australia, absolutely unoccupied and undeveloped. The productive capabilities of the waste lands are unbounded—rich soil, waiting for the plow, extends for hundreds of miles in every direction among the savannahs of Queensland alone; while the land teems with undeveloped mineral wealth. We are, for the most part, dimly aware that Australian tin is a commodity in the market, also that the gold mines of that country were at one time of great importance; while some may have heard of the more recent silver-mining enterprises carried on in New South Wales. But how many people realize that the biggest tin mine in the world is in Tasmania—Mt. Bischoff; that Queensland boasts the greatest gold mine in the world, at Mt. Morgan; that the biggest silver mine is the Broken Hill Proprietory in New South Wales, and that one of the largest copper mines of the world is situated at Moonta, in South Australia, while around Newcastle, in New South Wales, are some of the most extensive coal measures anywhere to be found. The mineral treasures of the country have, indeed, only been tapped hitherto, and but an infinitesimal portion of the buried wealth of Australia has yet been brought to light. Her agricultural industries are of great importance, the export trade in wool, fruit, frozen meat, butter, &c., is rapidly growing, and the possibilities of expansion in this direction are practically unlimited. Population and capital are the two requisites which are loudly called for in order to effect the development of all these great resources. Difficulties attendant on the "labor question" and the faulty system of government at present obtaining in the different colonies are, it is said, responsible for their present embarrassments. These are the reasons which have blocked the flow of immigration to Australia and diverted much needed capital into other channels. With her vast advantages properly and adequately developed, Australia would undoubtedly progress marvelously and quickly become a leading power in the world. But as it is, to quote Mr. Mitchell, "so far as population is concerned, Australia, outside a few score of large cities and towns, is virtually a wilderness."

The Governor of New York has affixed his signature to the bill providing for the punishment of persons willfully procuring the publication of false statements. It cannot be denied that the financial scare from which we have lately suffered was greatly aided by the circulation of rumors having no foundation in fact.

TRADE REPORT.

The Iron Market.

The financial question still overshadows everything else in the Iron trade. The feeling of distrust which prevails throughout the country has had a depressing effect upon the market, the condition of which can only be described as dull and apathetic. Little interest appears to be manifested in either buying or selling anything on terms usually available, and no present indication exists of any upward change. Meanwhile better collections in one or two sections of the country are reported, although in the East conditions in this respect continue unsatisfactory. The financial flurry of last week in Chicago passed over without any unpleasant consequences, the panic not extending much beyond the savings banks, which stood the strain easily.

Pig Iron.—The market in New York is very dull, and there are indications of increasing pressure to sell by some Southern companies in need of money. It appears that only about one-half of the 17,000-ton Cast-Iron Pipe contract for the East River Gas Company has been let. We quote Northern brands at $14.50 @ $15.25 for No. 1; $13 75 @ $14.50 for No. 2; $12.25 @ $12.50 for Gray Forge, tidewater. Southern Iron, same delivery, $14 @ $14 50 for No. 1; $12.75 @ $13.50 for No. 2, and $13 @ $13.50 for No. 1 Soft; $11.75 @ $12.50 for Gray Forge.

In the Chicago market inquiry for Coke Iron is very light. Production is being curtailed on account of the accumulation of stock. Northern prices are unchanged, but Southern prices are decidedly irregular, and very low rates are named on some brands. Cash would secure good bargains if buyers knew just where to place their orders to advantage. Lake Superior Charcoal is quiet, large buyers not being in the market at present. On such small lots as consumers are taking, prices are reported as fairly steady. Southern Charcoal is selling at very low rates. Quotations are as follows, cash, f.o.b. Chicago:

Lake Superior Charcoal.....	$16.25 @ $16.50
Local Coke Foundry, No. 1...	14.75 @ 14.25
Local Coke Foundry, No. 2...	14.00 @ 13.25
Local Coke Foundry, No. 3 ..	12.75 @ 13.00

Business is extremely dull in Philadelphia and district. There is a general feeling of uncertainty which prevents either buyers or sellers making bids or offers, unless at figures wider apart than usual. Good Irons are not in large supply, and while it is possible to get all the Iron required at quoted rates, it is not going begging. In the prices of good Irons there is absolute strength, the uncertainty being in regard to brands which nobody particularly cares to buy. Southern furnaces are reported as reaching Philadelphia by water, and large sales of No. 3 Foundry have been made within a day or two at as low figures as were made before the advance in rail freights. The general demand, however, is for small lots, and prices quoted as follows for Philadelphia and equivalent points, with 20¢ @ 30¢ less on brands at Harrisburg and intermediately to Baltimore:

American Scotch, No. 1X...	$16.00 @ $16.50
American Scotch, No. 2X...	15.00 @ 15.50

In Southern markets Pig Iron has reached still lower depths of depression than before, not that prices are quotably lower, but there are no buyers at any price. In almost every instance the furnaces have been requested to make no shipments on contracts, because the withdrawal of banking facilities renders it practically impossible to receive and pay for the Iron. The Iron trade is practically suspended, and it seems probable that it will remain so until there is an improvement in the financial situation. There is so little Pig Iron of any kind selling that there is nothing upon which to predicate prices, and while the stronger Southern companies and furnaces are not offering to sell at lower rates, there is no doubt that there are furnaces so pressingly in need of money that a cash buyer could obtain material concessions. It is not that the Iron trade is not in a fairly healthful condition, but it is forced into inactivity by the lack of the usual financial facilities. Quotations are as follows:

Foundry.

Southern Coke, No. 1.	$13.00 @ $13.25
Southern Coke, No. 2.....	11.50 @ 11.75
Southern Coke, No. 3.....	11.00 @ 11.25
Ohio Soft Stone Coal, No. 1....	16.00 @ 16.25
Ohio Soft Stone Coal, No. 2....	15.00 @ 15.25
Lake Superior Coke No. 1.....	15.00 @ 15.25
Lake Superior Coke No. 2.....	14.00 @ 14.25
Hanging Rock Charcoal, No. 1..	18.50 @ 19.00
Hanging Rock Charcoal, No. 2..	17.50 @ 18.00
Tennessee and Alabama Charcoal, No. 1	15.00 @ 15.50
Tennessee and Alabama Charcoal, No. 2.....	14.00 @ 14.50

Metal Market.

Pig Tin.—The one prominent feature is that the recognized "bull" leaders, with some trade assistance, have effectually manipulated prices in a manner calculated to somewhat allay the uneasiness of customers who loaded up heavier than usual during the time that prices dropped from about 21¢ to 19¢ ℔ lb. This serves to facilitate deliveries at the present time and to cut down the "visible" supply in a manner. The arrivals here thus far this month have been 1340 tons, and there are now 365 tons on the way from Europe.

Copper.—Lake Superior Ingot Copper has been sold during the past week at 10¾¢ ℔ lb. There were rumors of some large contracts having been made at as low as 10½¢, and back of those rumors is the substantial fact that a great deal of Electrolytic Copper has latterly been shipped in where the Lake product formerly had an almost clear field. Business in Electrolytic Copper is said to have been done at as low as 10¼¢, though popular quotation is 10½¢. Common Casting Copper is quoted at 10¢, but that price seems extremely high at the present time.

Pig Lead.—Sales of Common Domestic have been made this week at 3¾¢, which fairly reflects present market value. Stocks here are moderate, and advices from the West are to the effect that the surplus there is rather below the average, but the power of the leading buyers, along with the condition of the money market, still offsets the statistical position.

Spelter.—The market is bare of new feature. The offering from primary points has been somewhat reserved of late, and the demand from Eastern consumers continues extremely tame; hence a slow market, yet apparently steady undertone to values. Current quotations are 4 25¢ @ 4.30¢, Eastern delivery, for near future shipments.

Antimony.—Of small parcels there has been a fair movement, and the market is quite steady, with Hallett's, quoted at 9¾¢ @ 10¢, L.X. at 10¢ @ 10⅛¢ and Cookson's at 10⅝¢ @ 10½¢, in wholesale lots.

Tin Plate.—Buyers are still taking hold in a very indifferent manner. Their purchases of spot stock are invariably small and the most attractive inducements offered thus far fail to stimulate interest in future deliveries. Prices are unsettled and lean more or less in buyers' favor.

THE ILLINOIS GLASS COMPANY, Rockford, Ill., among the largest manufacturers of Glassware in the country, are now manufacturing the Manny Lemon Juice Extractor. Their No. 2, or saucer extractor, is a very convenient article. It is made of heavy glass, and the saucer prevents the loss of any juice, at the same time doing away with the discomfort of soiling the hands when using it.

Chicago Report.

Scrap.—Old Material is very quiet. Dealers quote buying prices as follows:

	Per net ton.	Per lb
No. 1 Wrought Scrap	$12.00	....
Machinery Cast	9.00	....
Malleable Cast	7.00	....
Stove Plate (free of burnt)	6 50	....
Burnt Iron and Grate Bars	4.00	....
Sheet Iron and Hoops	3.00	....
Plow Steel and Breaking Stock	8.00	....
No. 2, such as Shovels, Hoes, &c.	4.50	....
Old Boilers—whole (Iron)	7.00	....
" (Iron)—cut in single Sheets and Rings	10 00	....
Old Gas-Pipe and Boiler Tubes	7 50	....
Cast Borings	4 00	....
Turnings	5.50	....
Horseshoes	2 00	....
Copper Bottoms	....	8 ¢
Copper Clips and Heavy	....	9 ¢
Heavy Brass	....	8 ¢
Light Brass	....	4 ¢
Pipe Lead	....	8 ¢
Tea Lead	....	2¾¢
Zinc	....	3 ¢
Rubber	....	2¾¢

Anthracite.—Quotations on carload lots of 12 net tons are continued as follows:

	Grate.	Egg, Sto. and Ch.
Chicago, Ill.	$5.60	$5.85
Milwaukee, Wis.	5.60	5 85
Kansas City, Mo.	8 80	9.05
Council Bluffs, Iowa	8.80	9.05
Lincoln, Neb.	8.95	9 20
Sioux City, Iowa	8.80	9.05
Aberdeen, S. Dak.	8.85	9.10
Dubuque, Iowa	6.90	7.15
Madison, Wis.	7.10	7.35
St. Paul, Minn.	8 10	8.35
Burlington, Iowa	7.10	7.35
Des Moines, Iowa	8.55	8.80
Davenport, Iowa	6.90	7.15
St. Joseph, Mo.	8.80	9 05
Leavenworth, Kan.	8.80	9 05
Omaha, Neb.	8.80	9 05

Colorado Anthracite.

COLORADO FUEL & IRON COMPANY.	
Denver	$8.00
Pueblo	8.00
Colorado Springs	8.00
Leadville	8.00
Cheyenne, Wyo	10.00
All points between Denver and Missouri River	9.35

WALLACE & SONS, 29 Chambers street, New York, have greatly enlarged their facilities for suitably showing their large and constantly increasing line of Lamp and Art Goods. Since occupying their present quarters, east of Broadway, various expedients have been resorted to in order to adequately exhibit the numerous patterns of banquet, piano, library, boudoir and other Lamps, until recently they secured about two-thirds of the loft above them to be used exclusively as a display room for Lamp goods, Pedestals, Tables, &c. This display room is reached by means of an ample hardwood stair case about the middle of the building, on the Broadway side. The new rooms add 2800 square feet to what the firm had already possessed. One point made by the management is that a complete stock can be selected here from the most primitive and inexpensive Lamps to those costing upward of $100 each, in addition to the numerous art goods referred to above.

NORTON EMERY WHEEL COMPANY, Worcester, Mass., are extending their works by an addition about 50 x 40 feet on the north and one on the west, 37 x 44 feet, both two stories and basement. They are also erecting new kilns and hope to thus increase their facilities for production something over 50 per cent.

CONDITION OF THE

Hardware Trade.

THE BUSINESS IN HARDWARE, as in trade in general, is much affected by the financial uneasiness which so generally prevails, and as a rule merchants are only purchasing goods which are required for their trade in the near future. Manufacturers and jobbers are also refraining from urging sales with as much enterprise as usual, unless there is a prospect of their receiving prompt payment, there being a disposition to restrict business closely to cash transactions. There is, however, evidence of a somewhat improved demand, many of the jobbing houses reporting a fair, though not heavy, business, and on the whole, a more satisfactory trade than a few weeks ago. In the matter of prices there is but little change. The market is not characterized by a strong tone, but the indisposition to force goods on the market has a tendency to keep prices from being cut to any great extent. Most houses are at present giving their attention to the matter of collections, in regard to which a good deal of complaint is made, though in this respect the situation is probably a little improved.

Advices from Chicago.—The condition of the Shelf Hardware trade has changed materially within the past week. Business is now moving along vigorously and some jobbers say their orders for the past few days have been up to their capacity for handling goods. The demand is general, running through the whole line, except staple goods. Collections are also growing better. City collections jumped up last week, notwithstanding the panicky feeling among savings depositors. It is presumed that many of them paid accounts with the money which they drew out, thus enabling merchants to pay their bills more promptly.

Notes on Prices.

Cut Nails.—During the past week there has been only a moderate amount of business in Cut Nails, and prices remain on substantially the same basis as at our last report. The market is fairly represented in the East by the quotation of $1.05 on carload lots at mill, though it is understood that this figure has been slightly shaded in some special cases. Small lots from store in New York are held at about $1.25.

Advices from Chicago.—New business is rather quiet, and specifications are coming in slowly on old contracts. Factory prices are still nominally held at $1.25, but competition for business is less keen from outside concerns, and this price is more nearly maintained at present than a week ago. Small lots are selling from stock at $1.35.

Wire Nails.—The Wire-Nail market continues irregular with a fair, but not especially heavy, demand. The low prices developed had the effect of securing some large orders, but in the present condition of the money market the trade are not disposed to purchase on speculation, their orders being confined for the most part to their early requirements. During the week sales have been made at $1.35, f.o.b. mill, and while some manufacturers refuse to meet this figure it is intimated on the other hand that it has been slightly shaded by others. At the meeting held last week in Cleveland nothing definite was accomplished except the agreement to shut down the mills during July. The feasibility of effecting a strong organization among the manufacturers is, however, under consideration, and it is thought by some well-advised parties that the prospect for accomplishing something in this direction is more favorable than when the attempt was last made. It is thought by some directly interested that an organization by which the production would be limited and the price held at a remunerative figure is the only means by which the extremely unsatisfactory condition of the market in this line can be improved.

Advices from Chicago.—The recent drop in the factory price of Wire Nails leads to a great deal of business. Quite a number of heavy contracts were taken at the low rates prevailing last week. The demand continues in a small way, so that manufacturers are more encouraged than they were. They are inclined to think that prices have seen their worst. Quotations from factory are pretty generally $1.50, Chicago. Prices from stock for small lots are maintained at $1 65 to $1.70, with concessions to best buyers.

Barb Wire—Quotations on Four Point Galvanized continue on the basis of $2.45 to $2.50 for carload lots at mill. The volume of business is fair but not heavy.

Advices from Chicago.—Manufacturers report an improved demand for Barb Wire from factory. Buyers are hurrying shipments, indicating that stocks are low. The orders recently received have in many cases come by telegraph. Quotations are continued at 2.15¢ for carload lots of Painted and 2.55¢ for Galvanized. Local jobbers report their trade quiet, but quotations are steady at 2.30¢ and 2.70¢ respectively.

Tacks.—Atlas Tack Corporation, 508 Sears Building, Boston, issue under date, June 5, a revised discount sheet on Hardware list goods, which is, however, in the main the same as their last. Revised quotations are, however given on Basket and Trimmers' Tacks and Trunk and Clout Nails, the discounts on which are now as follows:

	Per cent.
Basket and Trimmers' Tacks, Lauc	52½
" " " S. S.	55
Trunk and Clout Nails, black	65
" " " tinned or coppered	67½

These prices are subject to the regular additional discount of 25 and 2 per cent. for cash.

The Atlas Tack Corporation also issue under date June 5 a revised Shoe Finders' List embodying many changes, a large number of which are in the way of advance.

Ideal Dipper.—Sidney Shepard & Co., Buffalo, N. Y., are manufacturing this Dipper of IXX tin plate with the handle riveted to the bowl, in one size, as follows: Diameter of bowl, 6½ inches. Depth of bowl, 3¾ inches. Length of handle, 9¼ inches. The Dippers are sold at $2 per dozen net.

Kettle Cleaner.—Clauss Shear Company, Fremont, Ohio, are manufacturing this article, which was illustrated in a recent issue. The Cleaner is sold to the trade at $2 per dozen.

Hot-Air Dampers.—Excelsior Hot-Air Dampers are manufactured by the Excelsior Steel Furnace Company, 110-114 South Jefferson street, Chicago, Ill., in sizes from 7 to 16 inches in diameter. They are sold at a discount of 50 per cent. from the list as published in their 1893 catalogue.

Puritan Coffee Pot.—Bronson Supply Company, Cleveland, Ohio, and 72 Beekman street, New York, are manufacturing this article, a description of which appeared in a recent issue. The Coffee Pot is sold from the following list, which is subject to a discount of 25 per cent.:

No.	20	30	40	50
Pints	2	3	4	5
Per dozen	$6.50	$7.50	$9.00	$10.50

Columbia Roaster and Baker.—This article is put on the market by the Star Baker Company, Bellville, Ohio. The device is sold from the following list, which is subject to a discount of 55 per cent.:

Number.	Length. Inches.	Width. Inches.	Hight. Inches.	Smooth Iron.	Russia Iron.
1—Small family	14½	9	7	$1.00	$1.50
2—Medium	16½	10¾	8	1.35	2.00
3—Large	18½	11½	9	1.50	2.30

Mrs. Potts' Sad Irons.—Under date of June 12, Enterprise Mfg. Company, Philadelphia, withdraw the former net prices on Mrs. Potts' Cold-Handle Sad Irons, and announce the following in their stead:

No.	In lots of 25 doz. sets at one shipment.	In lots of 12 doz. sets at one shipment.	In lots of less than 12 dozen sets.
50, per set	$0.78	$0.83	$0.90
55, "	.73	.78	.85
60, "	.90	.97	1.05
65, "	.82	.88	.95
550 (Containing Nos. 82, 90 and Set No. 50 Irons)	2.35	2.50	2.75
535 (Containing Nos. 87, 95 and Set No. 55 Irons)	2.20	2.35	2.60

Handles in lots of 25 dozen are sold at $1.30 per dozen; in lots of 12 dozen, $1.40, and in lots of less than 12 dozen, $1.55 per dozen.

Glass.—Locally there is little of interest to report in the Glass market, as the situation remains practically unchanged since our last report. Some Glass is changing hands, but the demand is light, and there is apparently no indication that trade will improve during the present month. It is believed that official prices are well sustained, but it is a question whether such a condition would exist if the time for the annual closing of the Glass factories was not near at hand. This, with the reported scarcity of single strength Glass in manufacturers' hands, and the pledges made by the members of the National Window Glass Company, have given prices unusual strength for a time when demand is as light as at present. Imported Glass has shown no improvement, and unchanged quotations of 75 and 10 and 5 per cent. discount nominally represent the price at which it is sold. It is reported that the National Plate Glass Company have decided to close their factories until July and perhaps longer, unless demand improves and present stocks are considerably reduced. We quote prices unchanged as follows: American Window Glass, 2000 boxes at one time, 80 and 10 and 10 per cent. discount; carloads, 400 boxes, 80 and 15 per cent. discount; less quantities than carloads, 80 and 10 per cent. discount. Freight allowed on car lots and over, not to exceed 17½ cents per 100 pounds; less than car lots, f.o.b. at shipping point. French Window Glass, 75 and 10 and 5 per cent. discount. American Plate ranges in price from 50 and 10 and 7½ per cent. discount to 60 and 5 per cent. discount. Imported Plate Glass, 60 per cent. discount to 60 and 10 and 5 per cent. discount.

Old Rubber.—The following are the current prices paid for Old Rubber delivered in New York:

Car Springs, ton lots, ℔ lb.	....	@	$0.03½
Rubber Shoes, ton lots ℔ lb.	....	@	.04
Large Hose, ℔ ton	....	@	9.00

Mixed Bagging	℔ lb		1 ¢
No. 2 Bagging	℔ lb		8¼¢
Hemp Twine	℔ lb		2½¢
Manila Rope	℔ lb		2¼¢
Jute Rope	℔ lb	1⅜ @	2 ¢
Mixed Rope	℔ lb	¾ @	⅞¢

Trade Notes.

The Loyhed Tinware Mfg. Company, 1317 Front street, Seattle, Wash., which were organized in December last for the purpose of manufacturing pieced Tinware, and the jobbing of Stoves and Sheet Metals, are said to be one of the most successful manufacturing and jobbing houses on that portion of the Pacific Coast. At present the company are confining their manufacturing efforts to the production of Tin Cans, for which there is a large demand. They are turning out in quantity Spice, Baking, Powder, Syrup and Fruit Cans, in various styles and sizes, together with some Salmon Cans. Prospects with them are reported as very good. The members of the concern are F. A. Hill, president; E. H. Loyhed, manager; and D. B. Porter, treasurer.

The Milton Smoke Burner Company have been incorporated at Alexandria, Va., to manufacture Milton's gas and smoke burning apparatus. Capital stock $10,000.

"At Home" June 12–16, is the inscription on the first page of a folder which reaches us from H. M. Hillson of 93–97 North street, Boston, Mass. Mr. Hillson has just opened his new salesrooms and offices at the address given and from June 12 to 16 was "at home" to all his friends in the trade. His force of traveling salesmen were on hand to welcome customers and friends and to show them about the new quarters.

E. T. Barnum, Detroit, Wis., has just secured the contract for the fittings for the cavalry stables at Fort Leavenworth, Kansas. The stables are two fine large brick buildings, arranged for 144 horses, and will be provided throughout with the most improved stable fixtures, such as hay racks, oat mangers, saddle and bridle brackets, harness hooks, &c. Seventy-two ventilators will be placed in the stables, and each of the 76 windows covered with galvanized-wire guards.

W. E. Beveridge, 305 South Sharp street, Baltimore, Md., has purchased the United States patents on a smokeless Fry Pan, which he proposes to introduce to the trade. The Fry Pan is intended for use on a range or cook stove, to carry off all odor or smoke, or in the ordinary way on a gas, gasoline or coal-oil range in summer. We understand that Mrs. Rorer, principal of the Philadelphia Cooking School, is using one of these Fry Pans in demonstration at her Model Kitchen at the World's Fair. She is likewise using one of Mr. Beveridge's Steam Cookers. The smokeless Fry Pan is made in three sizes.

MATTHAI, INGRAM & CO., Baltimore, Md., issue a catalogue of summer and new goods. The pamphlet of 7¼ x 5½ inches, contains 20 odd pages of illustrated matter respecting seasonable articles, beginning with Fly Fans. Next come Water Coolers of various designs and shapes; Tubs of all sorts; Kettles, Lemonade Shakers, Fruit Cans, Oil Cans, Dripping Pans, Watering Pots, Soap Dishes, Coffee Boilers, Dippers, Fly Traps, &c. Along with the illustrations are printed tables of sizes and prices, and a discount sheet accompanies the pamphlet.

THE AMERICAN SHEET IRON COMPANY, Phillipsburg, N. J., report a large and steady demand for their "American R. G." black sheets. Last year the company put in an English or tight iron mill with the view of producing black sheets for tinning, but have not used it for that purpose hitherto, the call for their regular black iron sheets having kept them fully employed on that material. The company think that the consumption of domestic sheets by the tin-plate factories has increased the trade for regular sheet iron.

STRANSKY & CO., 27 Murray and 31 Warren streets, New York, have now in stock and afloat a full assortment of their Cameo Mottled Enameled Ware, in American shapes, embracing, we are told, upward of 800 styles, sizes and finishes. This ware is enameled on steel with three coats of enamel, and has long been sold by them on importation orders only. They will now be in a position to execute promptly from stock such orders as they may be favored with. They desire to say that this ware in no way infringes enameled goods made here, but if necessary they are prepared to give a written guarantee holding everybody harmless handling it. It is made in three finishes, vermilion-blue, gray and brown, and is very tasteful in appearance.

CINCINNATI MFG. COMPANY, Cincinnati, Ohio, issue a circular in which they state that they do not belong to any combination and call attention to the excellence of their Leader Fly Traps, Corn Poppers and other Wire goods.

THE J. T. HENRY MFG. COMPANY, Hamden, Conn., have recently completed a new building 40 x 24 feet, two stories high and built of brick, adjoining the old shop. New machinery also has been added and the plant equipped for special press work and the manufacture of Sheet Metal goods to order. This concern are pushing the sale of Henry's New Grape Shear, which is especially designed for picking grapes, but is also recommended for cutting flowers. The blades and jaws are made of best cast steel, carefully tempered, and the design is the result of a number of years experience in manufacturing articles of this character.

THE STOVER MFG. COMPANY of Freeport, Ill., have recently added to their already large works a galvanizing plant for galvanizing steel Wind Mills and a general line of job work. This has necessitated a considerable enlargement of their force.

The strike of dock laborers at Hull, England, which at one time threatened to extend to other of the British ports and cause as grave hindrance to shipping and commercial business as did the great strike of London dockers some time since, was ended in a complete fizzle. The dockers have surrendered unconditionally, and will only be taken back as vacancies occur. Employers retain the power to dismiss or refuse employment to any man who intimidates non-union or union men. None of the points for which the men went out on strike have been gained; so that their suffering and pecuniary loss have been for no purpose, except to gratify the vanity of the agitators. The causes of the strike were not sufficient to justify such a course of action as was resorted to, and the lawless methods used during its progress, in the way of incendiarism, mob violence and intimidation, alienated from the men the sympathies of the general public, and brought about the collapse which has taken place.

New Publications.

METAL PLATE WORK: Its Patterns and Their Geometry; also Notes on Metals and Rules in Mensuration. For the use of Tin, Iron and Zinc Plate Workers, Coppersmiths, Boiler Makers, Plumbers and Others. By C. T. Millis, M. I. Mech. E. London: E. & F. N. Spon. New York: Spon & Chamberlain. 1893. $3.50.

A second edition of the useful book of C. T. Millis on sheet-metal work has just been issued, which contains all the information included in the first edition, published five years ago, supplemented by some 70 pages of new and original matter. The work does not need any lengthened description, being, in its original form, well known to metal workers. The author is an established authority in the trade in Great Britain. He is now the head of the educational department of the Borough Polytechnic Institute of London, and also lecturer in sheet-metal work to the City and Guilds of London Institute, two of the foremost mechanical training schools in England. His qualifications, therefore, for a work of this kind are obvious. The present edition of "Metal Plate Work" is one of the Finsbury Technical Manuals. It is a well gotten up volume of 376 pages, with excellent text and illustrations, the latter including some 250 patterns, and is calculated to be an exceedingly useful manual to the sheet metal worker anxious to master his trade. Starting with some introductory geometrical problems, the work is divided into four sections. The first three treat, respectively, of "Patterns for Articles of Equal Taper or Inclination," as pails, oval teapots, strainers, &c.; "Patterns for Articles of Unequal Taper and Inclination," as baths, hoppers and canister tops, and "Patterns for Miscellaneous Articles," elbows and articles of compound bent surfaces, such as vases, aquarium stands, moldings, &c. The fourth division comprises a chapter on the metals, alloys, solders and soldering fluxes, mostly used by metal workers, and one on the more important seams or joints used in sheet metal practice. It concludes with a number of useful practical rules in mensuration, and tables of comparative weights and gauges of various metals, together with the strength, sizes and weights of tin plates. Taken altogether, the book in its new form is a serviceable addition to the somewhat scanty literature of the trade, and will doubtless find a welcome among the sheet-metal workers in the United States.

A bill for the prevention of accidents and protection of the life and bodily safety of workmen is at present before the Italian Parliament.

System.

Given a good business or a good practice, with reasonable ability, and there is certainly no one thing more conducive to success than system in its management. While the word "system" naturally carries with it the idea of good system, yet there is such a thing as a bad system, one perhaps good enough in its place, but absolutely unsuited to certain circumstances. Mere red tape is not system: but that perfection of management by which every action links into and is properly timed by another, where no effort is wasted, where everything is in its proper place and all methods are the most economical and approved truly deserves to be termed systematic. Such management may be considered as ideal, but such an ideal may well be sought by many a man with profit to himself.

Summer Care of Heating Apparatus.

It is a well recognized fact in the heating trade that use does not wear out steam and hot-water heating apparatus so much as *disuse*. Not the winter months, when heat is actively maintained, but the summer season, when the apparatus lies dormant, is the time when the metal of heating plants suffers the most. Contact of hot water or steam with the inner surfaces of heating boilers, pipes and radiators affects them very little; and when the pipes are hot, exterior surfaces are scarcely ever attacked with rust. But let the apparatus stand in a humid atmosphere in summer, and rust will eat into all unprotected parts. Hence, to preserve a heating apparatus requires some special attention at, or soon after, the time it goes out of use in late spring or early summer.

Exterior and Interior Protection.

All exposed pipes or metal surfaces should be covered with a suitable protective coating. For pipes, a good quality of black japan varnish should be used. Coils or radiators should be painted or bronzed, and pipes wrapped with non-conducting material ought also to be painted with black japan varnish, because both air and moisture will penetrate the porous insulating material and get in their fine work upon the metal surfaces if the latter are left unpainted. When heat is no longer wanted, the furnaces, flue spaces and the smoke pipe should all be thoroughly cleaned. The accumulations of soot from fuel draw moisture, and, when moist, these are corrosive in their action upon iron, especially when the repellant effect of heat does not counteract this tendency. The cleaner the metal can be kept when out of use, the longer it will last. As to whether it is better to leave water in or out of pipes and boiler, there are conflicting views. Pipes filled with cold water are not much attacked by rust if air be excluded; but in a hot-water system valves may get to leaking, or other leaks may take place, and many prefer to draw all the water off when the apparatus goes out of use. A good way with either steam or hot-water apparatus is to heat up the plant and then draw out the water while hot, leaving open the air valves and blow-off cock till the whole system has had time to dry out, which, when the surfaces are hot, will be not not more than an hour or so after the water has been drawn out. Then everything should be closed to exclude any interchange of air to and from the interior. If these precautions are strictly observed each season, an apparatus may be made to last some years longer than it would if neglected.

A Departed Race.

Easily within the recollection of many now living is the time when the inhabitants of rural districts obtained supplies of tinware largely from itinerant venders, who, in country parlance were called tin peddlers. Great was the delight of the farmers' children to see coming over the brow of the hill the quaint wagon, hung about with its glittering wares, and when it stopped before the house how they used to cluster about it, curious to see what its interior contained. The owner of the vehicle and its contents was a peddler of news as well as of tinware, and hence was always welcome to the house whether anything in the tin line or not was wanted. He was often a quaint character who could crack his joke with the best, could tell a good story, or sing a song, and so when he stayed over night, as he would be apt to do if arriving at nightfall, paying for his accommodation in tinware instead of coin, he became the center of an interested group. The race of tin peddlers has gone the way of many other peculiar characters who flourished a few years ago. The large manufactory and the village store were too much for him, and he no longer adds a picturesque feature to travel on country roads, or brings an occasional relief to the monotony of the farmer's life. But in his day he was useful, honest and industrious, and an interesting factor in a trade that while it has outlived the tin peddler, has grown into proportions that give it rank among the world's most important industries.

The Local Tinshop.

The local tinshop has also felt the effects of the centralization that is going on in all lines of manufacture. From stores of manufactured goods kept in these shops the tin peddler used to stock his wagon, and before such a shop was frequently seen standing the peddler's vehicle, while the owner was inside making purchases. In those days all time between outside jobs was put in making up goods, as a lot of tin candlesticks, a quantity of milk pans, tea kettles, pie pans, pepper boxes, tin funnels and so on, all of which were stock articles, sure to sell at prices that would yield a profit. Then a journeyman tinsmith could travel from town to town, sure of finding employment without tramping off the soles of his boots; and there were many of them who knew more about the geography of the country and the peculiarities of the towns and their populations than the Congressman from the same district. Now the methods and tools then in vogue cannot be used for general manufacturing in competition with factory methods and machines, and the old-time tinshop, with its hand methods, has changed into a place where about all the work is tin roofing and the manufacture of tin and sheet-iron work for heating apparatus. There are yet journeyman tinners, but they are not the journeymen of old, some of whom could make anything that could be made of tin, and who could lay out patterns for any kind of work. The local tinshop as it used to be has gone with the race of tin peddlers.

The Pratt Institute of Brooklyn.

Few nobler or more beneficent monuments have been left by American men of wealth than that which perpetuates the name and memory of the late Charles Pratt in his native city of Brooklyn. The great educational establishment known as the Pratt Institute, to one phase of which we have referred in another column, based as it is upon an appreciation of the dignity, as well as the value, of intelligent handicraft and skilled manual labor, stands out as a grand and enduring

testimony to the truth and soundness of its founder's conviction that the manual and industrial education of its individuals underlies all the prosperity and progress of a community or a nation. The idea of a perfect education conceived by this practical philanthropist is one in which mind, eye and hand are together trained, securing symmetrical development. This idea it is which is being carried out in its integrity in the Pratt Institute. While literature, science and art are taught, the students, both male and female, are trained in handicrafts of some sort, as an essential part of their general education, although they may not propose adopting manual labor as their business or profession in after life. This feature is considered on an equal basis with the regular academic studies, and is calculated to invigorate the mental faculties of the student and prepare him more fully for the ordinary activities of life, giving him a discipline and strength of judgment which cannot fail to have a fortifying effect upon his character. To those, however, who do propose to take up a handicraft as their calling in life, the education such an institution offers, adding mental to manual training, must be invaluable.

Ten Years' Progress.

"No other country in the world ever advanced in population and wealth as the United States is doing. The progress of the past shows no signs of halting. In fact, the development of our foreign and domestic trade and commerce, and of our industrial interests, is steadily broadening out." So writes Richard H. Edmonds in an interesting and instructive paper recently contributed to the *Engineering Magazine* and the facts and figures marshaled in support of his verdict amply bear out its justice. A progress truly marvelous in character and extent is demonstrated in the history of the United States for the decade 1880–1890. Comparison of the statistics of population and wealth at the former period with those shown in the returns for 1890 reveal a growth and expansion absolutely unparalleled in the world's history. It has been, moreover, a well-proportioned growth, a steady advance all along the line of population, commerce, industries, and all that makes for the material prosperity of a country, including education and intelligence. The presentation of a few facts culled from the paper above quoted will give some conception of the amazing progress of this country during the ten years in review, a decade which, it may be mentioned in passing, will stand in history as, above all, remarkable for the great developments in the application of electricity which it witnessed. Twelve years ago that force, as applied to power, motive and illuminating purposes, was just in its infancy, and the aggregate capital invested in it was small. To-day it reaches a sum estimated at $800,000,000.

In the ten years from 1880 to 1890 the population of the United States increased from 50,100,000 to 62,500,000, or 24.8 per cent. This means that 3,000,000 more inhabitants were added to the population than are contained in the aggregated populations of the 28 American cities numbering over 100,000 of population to-day. A striking illustration of the remarkable growth of Western cities, especially during the decade, is shown in the following instances, which give a good idea of the extraordinary development which has taken place in that section of the country:

Population of	1880.	1890.
Chicago	503,185	1,099,850
Minneapolis	46,887	164,738
Omaha	30,518	140,452
St. Paul	41,473	133,156
Kansas City, Mo.	55,785	132,716
Denver	35,629	106,713
Lincoln, Neb.	13,003	55,154
Los Angeles, Cal.	11,183	50,395
Portland, Oregon	17,577	46,385
Duluth, Minn.	3,483	33,115
Seattle, Wash.	3,553	42,837
Tacoma, Wash	1,098	36,006

And we find that wealth has increased even more rapidly than population. The gigantic railroad and industrial developments of the decade enormously increased the volume and value of property. It is estimated that the absolute wealth of the United States in 1890 was about $63,648,000,000, or an approximate gain of $20,000,000,000 in ten years, leaving out of account the increase in railroad property. At the end of 1880 we had 93,200 miles of railroads with capital invested to the extent of nearly $5,000,000,000. At the end of 1890 these figures had increased to 166,700 miles of railroad representing a capital of little less than $10,000,000,000. The gross value of manufactures during 1890 was about $8,600,000,000, against $5,300,000,000 in 1880, showing an enormous gain of $3,300,000,000. The capital invested in manufacturing industries reached $4,600,000,000, against $2,700,000,000 in 1880. The wages paid to employees in manufacturing establishments in 1890 were $500,000,000 more than in 1880: and the number of hands employed increased 900,000 during the period of ten years. In the progress of manufacture all industries alike show remarkable growth. The manufactured iron produced in 1890 showed a gain of 150 per cent. over the amount put out in 1880, and similar increase was marked in all departments of industrial effort. The mining industries also show similar expansion, having turned out $656,600,000 of products in 1890, against $369,000,000 just ten years before. This gain touched every branch of mining, but was principally marked in the output of coal, silver, copper and petroleum. Agriculture shared in the progress, but not to as great an extent as did the industries alluded to. A gain of $100,000,000 in value of agricultural products is, however, noted in 1890 over 1880. In concluding this cursory sketch, it may be well to mention that the national banking capital of the country increased from $467,000,000 to $662,000,000 in the ten years; and the deposits in savings banks from $819,000,000 in 1880 to $1,550,000,000 in 1890.

The Bertrand Process for Rust Proofing, Tinning and Enameling Iron.

Among the various means in use to protect iron from oxidation the Bower-Barff process, or some modification of it, has proved the most successful. It is well known that by this process a coat of permanent magnetic oxide is deposited on wrought and cast iron which, if proper care has been taken, will protect the coated surfaces for all time. This method has been in use in this country for many years and has given very satisfactory results, but owing to the necessity of a rather costly special form of furnace and the limited output of such furnace, its use has been restricted and has never reached the development that a cheap and rapid method of producing a coating of permanent oxide upon iron articles of any size or weight should have reached.

Researches in this direction have been going on for some time, and lately Pierre Henry Bertrand of Paris has brought out a new process by means of which iron can be coated with magnetic oxide rapidly, cheaply and effectively, in any furnace of ordinary construction. M. Bertrand discovered the fact that, when an iron article previously coated with a thin layer of a volatilizable metal or alloy is heated to a temperature at which the metal or alloy is volatilized, the protection afforded by this layer prevents the free access of oxygen to the iron surfaces, and the resulting oxide, instead of being a sesquioxide, or Fe_2O_3, is a magnetic oxide, or Fe_3O_4, of a fine blue slate color.

M. Bertrand, perceiving that the ultimate success of his process depended upon a cheap and rapid way of placing upon the surface of the articles to be blued the first thin layer of alloy, developed a new method by which this can be done in a few seconds. It consists in the preparation of a bath or mixture in which the salts of the metals to be deposited are dissolved. Upon simply dipping the articles in this bath, without the aid of electricity, the metals of the salts are quickly precipitated upon the surfaces, so that the whole operation of alloy, coating and oxidizing is completed in 30 to 40 minutes. No special furnace is needed, and all there is wanted to form the coat of oxide is a stay of about ten minutes in an atmosphere of about 1000° C. With proper charging arrangements the furnace can run continuously at the rate of two charges an hour. The operation is very simple and requires no specially trained men, so that the process can be installed in any foundry at a trifling expense.

Pursuing the problem of coating articles with a thin layer of volatilizable metal or alloy a little further, M. Bertrand has succeeded in causing a durable coat of tin to be deposited on cast iron. The method is simple and inexpensive and is used extensively now in coating the inside of cast-iron cooking utensils, which are thus kept from oxidation and preserved from the usual inherent iron taste.

Further experimenting with articles coated with magnetic oxide by his process led M. Bertrand to discover a very cheap method of covering such articles with a layer of enamel, which may be varied in design and color, as enamels usually are. The interesting part of this method is that any article of cast or wrought iron or steel may be enameled in any color at one single firing. Articles thus doubly coated with the magnetic oxide and enamel are non-conductors of electricity, and this property has led to their use in various electrical devices, such as parts of dynamos, isolating plates, conduits, &c. The oxide coating and enameling occupy less than an hour.

These processes have been in practical use at M. Bertrand's works in Paris for nearly two years, and the results have proved highly satisfactory. The usual products of the works are blued and tinned cooking utensils, blued and enameled soil pipes, enameled parts of electrical devices, blued railings and stable fittings, enameled mantel pieces to imitate various marbles, blued and enameled drinking fountains, &c. The pipe foundry at Pont-à-Mousson, the largest of the kind in France, has acquired the right for bluing and enameling gas and water pipes, and the cheapness with which these operations can be carried on bids fair to develop a large trade, not only in that line, but in the coating of all iron exposed to the weather. M. Bertrand has an interesting exhibit at the Columbian Exposition in the French section of the Electricity Building.

THE LETTER BOX.

Thickness of Tank Material.

From C. A. N., *Alliance.*—Will you let me know through the columns of the paper whether a tank made of No. 20 galvanized iron, 54 x 54 inches, would be of sufficient strength to hold ten barrels of gasoline? I riveted the side seams and double riveted the bottom.

Answer.—If the tank is cylindrical and strengthened by bands of $\frac{1}{4}$ x 2 inch iron at frequent intervals, and well secured otherwise, the No. 20 iron will stand, but a much heavier gauge is preferable. If the tank is to be rectangular its hight would be about 40 inches to hold the quantity mentioned, and in that case much heavier iron should be used. Braced only with angle iron at the top, a well-established tank maker states that iron $\frac{1}{16}$ inch thick should be used. If a number of angle-iron braces are used to stay the sides, and are put on so as to give the greatest strength, much lighter iron could be used, but a heavy material would save the extra labor and cost of the extra angle-iron braces.

Dangers of the Copper Kettle.

From E. T., *Boston.*—Those who have been connected with the sale, manufacture or use of copper cooking utensils, having the interior nicely tinned, must be somewhat surprised in reading the following account regarding how so-called copper kettles deport themselves in England. A correspondent of the Sheffield *Telegraph* says: A Sharrow gentleman was always unwell at home and invariably got better when he left. The symptoms were those of lead poisoning, including the much dreaded "drop-wrist." An idea struck him. It was the copper kettle. He had it cut in two and found the alleged copper kettle was three parts lead, which the hot water had liberated and assimilated with the sufferer's system. The copper kettle has been discarded and there is no more ill-health. A gentleman brought me the lid of one of these so-called copper kettles. The surface only was copper, the rest was lead, which left the copper freely to the thumb touch. It is said that a large number of people have recently experienced all the effects of lead poisoning and the evil has been traced to the copper kettle, which is now a discarded utensil in many households.

The Sharrow gentleman little thought when he purchased the bright copper kettle that it was to be the means of starting a lead mine in his interior and be as bad for his health as an army of microbes. If this gentleman was unwell while at home and got better when away, and if lead soup from the copper kettle caused his illness, he certainly recovered rapidly when out of the house. It is also stated that when the copper kettle is cut in two it is found to be three parts lead. Was there ever a copper kettle made that was even lined with lead, let alone being three parts lead? The cover belonging to another kettle is put on trial, and it is stated that it has a copper surface only, the rest being lead. Can lead masquerade as copper and become so demoralized as to be removed with the thumb? As a friend of the copper kettle, I would like to be informed by the readers of *The Metal Worker* if there is any truth in the story regarding lead-lined copper kettles as told in the above article.

A Leaky Steel Roof.

From B., *Medina, N. Y.*—I am troubled with a steel roof leaking at the seams. It is a steep roof with flat seams, and paint does not stop the leaks. Please inform me, through the columns of *The Metal Worker*, if there is any kind of paint or cement that could be applied to the seams that would stop the leaks.

Answer.—It is taken for granted that the roof our correspondent mentions really leaks, and that the trouble is not due to the condensation of moisture on the underside of the roof. Regarding what kind of paint or cement to use, there are a number of kinds of roofing paints and cements that would overcome the difficulty if properly applied. As it appears that paint alone is not adapted to stopping the leaks, it is suggested that cloth be tried in connection with a good quality of roofing paint or cement. First clean the seams by removing all dirt or scaly paint. Then take unbleached cotton muslin, in strips about 2 inches wide, and either saturate the same with thick paint or spread on roofing cement. The leaky seams are then to be painted and the cloth applied, being rubbed down smooth by means of the brush, so as to be brought in close contact with the roof. Cloth thus applied is sufficiently elastic to withstand the expansion and contraction to which metallic roofs are subjected.

Noisy Wash Basin.

From I. R. S., *Norwich, N. Y.*—I would like to learn through *The Metal Worker* what is the cause of the noise heard on emptying some wash basins? I have had trouble in this regard, and would like to find out the cause so that I might apply a remedy.

Note.—Our correspondent writing from the country, it is fair to assume that all the plumbing is not up to the modern standards, and that there are a good many traps in the houses without vent pipes, and a good many fixtures without traps. Under some circumstances this might account for the noise which might be produced by the air gurgling up through the column of descending water when the stopper was removed. If the lower end of the waste pipe was not free there would be more opportunity for this trouble, as the air could not escape along with the running water. Sometimes the waste pipes are so arranged as to increase the vibration and make the sound unnecessarily loud. But the satest remedy is to ventilate the traps, and see to it that there is a free flow from the lower end of the pipe.

Furnace to Heat Three Stores.

From CÆSAR, *Louisville, Ky.*—I notice an article in *The Metal Worker* of June 10 on heating three stores with one furnace. With a little figuring, I find that "E. E. W." has three 16-inch hot-air pipes, equal to 603 square inches area, and also three cold-air pipes, 14 x 15, giving 630 square inches of area. I think this is reversing the order of piping radically. We have in this job 73,920 cubic feet to heat (allowing at least 14 feet for elevation), which is near the estimated capacity of the largest furnace under favorable circumstances. To handle this amount of air from the outside, subject to an expansion of at least one-quarter, requires 600 square inches area and an outlet for the hot air of not less than 750 to 800 square inches. Now, "E. E. W." has a greater cold-air supply, which is expanded, probably, one-sixth above its normal condition, than he has hot air. This, in my opinion, will choke in the casing and retard the flow considerably. Let him increase the hot-air to 900 square inches, and let the north room have a cellar pipe at least 2 inches larger than either of the other two, and increase his cold air to 850 square inches. A reason for the latter is the cold air is already expanded to a certain extent and, consequently, requires a larger inlet. The remarks on elevation, &c., need no comment. My experience teaches me that to handle 75,000 cubic feet of air, 900 to 1000 square inches are necessary for hot air, and from 600 to 850 inches of cold, according to circumstances. Under this rule I am heating one store of 143,000 cubic feet, and another of 126,700. The first is heated at an expense of 50 cents per day. The latter has given such excellent satisfaction that the owner has notified me that he is going to build another house and wants another furnace.

Stafford's Extension Boiler.

From C. G. R., *Brooklyn, N. Y.*—Will some of your readers inform me through *The Metal Worker* where I can get repairs for Stafford's extension boiler, patented December 23, 1884, by the Buffalo Steam Heating & Mfg. Company, Buffalo, N. Y.?

A Steamer for Bugs.

From A. L. H., *Pocahontas, Va.*—Will some brother be so kind as to give through *The Metal Worker* the address of some tinner making a steamer to be used for killing roaches and bedbugs with steam?

The Government of India has sanctioned the formation of an engineering school in Burmah for training native youths for subordinate grades in the Public Works Department.

PLUMBING and GAS FITTING.

Things of Interest to the Plumber at the World's Fair.

The exhibits of plumbing goods are by no means truly representative of the industry of manufacturing in the United States, as many of the largest and most prominent houses are conspicuously absent. This may be due to activity in business, inability to secure acceptable space, the reluctance to enter into the enormous amount of tedious labor necessary and the expense following, or some other satisfactory reason that is not offset by the advantages derived from displaying goods before so many million of sightseers. Though only about a dozen of the exhibits that are grouped together just northeast of the center of the Manufactures Building are noticed here, there are many other goods of various character of equal interest, notably the pipe cutting and threading machines in Machinery Hall. Of what may be termed the plumbing exhibit it can be truly said that though the common, well-known and all-essential goods of every-day use are absent, what is displayed is largely of the specialty character, and correspondingly interesting.

STANDARD MFG. COMPANY,

Pittsburgh, Pa., were fortunate in securing a generous space which they inclose with columns of quartered oak and cover with a ceiling paneled, between the oaken rafters, with olive green plush. The floor is covered with an olive velvet Brussels carpet, and silk plush tapestries are draped back to the oak columns. At one side heavy silken cords and plush *portières* draped back inclose a magnificent bathroom. The floor, side walls and ceiling are tiled with white tile with a border at the top of the wainscoting of fluted tile with a gold band at the top and bottom. Above the wainscot the tiles are embossed with a *fleur-de-lis* in two sizes, the smaller one in gold. The ceiling tiles are secured by gold-plated studs giving the effect of stars. The room is furnished with a fine white enameled bathtub with a shower bath and curtain and a foot bath. The tubs are decorated with a row of olive *fleur-de-lis* between narrow gold bands. An onyx washstand is beneath a plate glass beveled-edge mirror in a narrow gold frame on the wall. A handsomely decorated Securo water closet completes the furniture. All of the pipes, cocks and fixtures are gold plated, giving a beautiful effect and making the bathroom in itself a most attractive exhibit, but the larger space is equally interesting to the plumber. There is a pool bath 52 inches square, white enameled, decorated with gilt bands, a mammoth bathtub similar to 12 that were furnished for the Mormon Temple at Salt Lake City for some religious ceremony, and several samples of their regular enameled tubs decorated in different styles, with a sitz bath, complete their display of bathtubs. Along the wall they show their Securo water closets in working operation, and a slop sink and some laundry tubs complete the exhibit.

PECK BROS. & CO.,

Chicago, New York, Boston and New Haven, attract the visitor with a fine display of plumbing fixtures, each one of which is a specialty. A Mosaic floor and a wall of hardwood in panels is inclosed by a railing, the nickel plating of which challenges admiration. The railing is acceptably ornamented with stop cocks of different styles, and at one end runs up into an arch supporting an artistic design in wrought-iron work, into which their name is worked. The arch is made to display different styles of basin cocks, by slabs of white marble, onyx, and old red Tennessee marble being a part of it. The arch also displays three drinking fountains of carved marble with a swan's neck supply. Through the center of the space a white marble portion is run with a space at each end. To this portion is attached a most elaborate display of lavatories, and, in addition to each one representing some special style of fixture for supply or waste or combination fixture, the beauty of the slabs to which they are attached is increased by the variety—a superb white onyx contrasting with a white marble slab. Other slabs are of Arizona and Mexican onyx and African yellow Sienna, Rose Numidian, Anstrian, violet and handsome selections of domestic and foreign marbles. This display of different marbles and onyx, as well as the various styles of nickel plated or solid bronze fixtures, will be of great interest to many plumbers and an education to the public. At the end of this display are some new goods in barber's lavatories, to which a shower bath is attached. Against the back, a handsome old red Tennessee marble stand is shown, with a mirror in a frame of the same material, for use in the hall of the modern residence. Another special attraction is a shower bath, circular in form, so made that water is sprayed in needle jets a couple of inches apart from every pipe or from a bidet, a jet, a douche or a shower, as desired, and a special mixer governs the temperature at any degree. Another feature is the array of Triple Jet, Gauntlet, Dorado and Glencoe water closets and their decorations. The flush tanks are of selected ornamental woods, and the shapes used in this display were specially designed for it. A silken canopy of the now popular "baby blue," with border of garnet and a silk fringe, hangs above.

SMITH & ANTHONY STOVE COMPANY,

Boston, New York and Chicago, have a very complete exhibit of their sanitary specialties. One side is devoted to water closets and a slop sink. The back displays lavatories and a hotel dish-washing sink with tank and grease trap. In the center is an enameled bathtub and an inclosed shower bath, formed of nickeled bars and curtains, intended for use over a drain and trap in the floor. The operation of their water closets and traps is shown by cutting away parts and cementing glass over the openings.

DAWES & MYLER,

New Brighton, Pa., make a specialty of sanitary enameled iron goods, and display some fine samples. The bathtubs attract great attention by their smoothness and the beauty of the decoration, mermaids and cupids, apple blossoms and flowers figuring largely. Sitz baths and foot baths, with lavatories, complete the display, which is by no means a full sample of the varied line of sanitary goods manufactured by the house.

OSWEGO INDURATED FIBRE COMPANY,

Oswego, N. Y., have carpeted their floor and inclosed it with an oxidized copper rail, and show bathtubs in different styles, plain and white, gilded and elaborately ornamented with designs in colors. Hip baths, lavatories and water closets of similar finish make an interesting display.

ALBERENE STONE COMPANY

of New York, Chicago and Boston, quarry a stone in Virginia that they claim is specially qualified for their purposes, by being of an even hardness and non-porous. Their display is attractive through the arrangement of griddles and culinary articles, with sinks and laundry tubs, the joints of which are of the dovetail character and cemented.

NORTON BROS.,

Chicago, display their hermetic seal, noiseless water-closet on a space which has a tile floor into the design of which their name is worked. The space is inclosed at the back and one end by a 7 foot wall, wainscoted with a cream tile for 4 feet, and above it is a scroll ornamentation with a molding to finish at the top. Against this the closets in different styles of finish, with the flushing tanks, are arranged. The closet works positively by a lever, which opens a valve of large capacity, emptying the closet, and when closed has in addition the usual water seal to prevent escape of gas and odor. The seal cannot be broken by syphon.

THE LENIER, JOHNSON, HOYER MFG. COMPANY,

Chicago, manufacturers of plumbers' brass goods and supplies, inclose a space of polished hardwood floor with a brass rail, and exhibit in showcases polished brass and nickel-plated bath, lavatory and sink stop cocks, a line of brewers' goods and hose fittings, with samples of enameled baths and sinks, water closets, air pumps and force pumps.

STEEL CLAD BATH COMPANY,

Detroit, Mich., make an interesting exhibit of bathtubs and fixtures. The tubs have an outside shell of steel, lined with planished copper, have a hardwood rim and are supported by four ornamental iron feet. A basin attachment is shown that can be used in connection with the bath where no lavatory is furnished, and a shower-bath attachment is exhibited which is a combination of the bath supply.

THE KILBOURNE & JACOBS MFG. COMPANY,

Columbus, Ohio, greet the eye on entering their exhibit, the letters being in dark wood in a hard-wood floor that has a wall of Troy border. A pot of

Japanese design, holding a palm, is in each of the front corners. Against a carved-oak back, bearing their monogram and in carved and gilded letters, "Wrought Steel Sinks," a fine display of these goods is made in different colors and decorations. At each side is a pantry table, covered with zinc and draining to a sink in the center and provided with hot and cold water cocks. All of these goods are enameled and claimed to be unaffected by heat.

STEWART CERAMIC COMPANY,

New York and Chicago, make an elaborate display of solid white crockery, stationary washtubs and butler's pantry, slop and kitchen sinks. The goods are all set up on oak platforms and the floor aisles are paved with blue and yellow tile. The exhibit is inclosed by a railing, embellished by wrought iron work decoration.

INSTANTANEOUS WATER HEATING COMPANY,

Chicago, show their rapid water heating apparatus in planished copper, nickel plate and oxydized nickel. Water is sprayed on cylinders that are heated by a gas burner, and about 30 gallons of water are heated in ten minutes, using 1½ feet of gas per minute. A portion of one of the apparatus is cut away so that the operation can be seen. The water heated to show the visitor is run off into a

BISCHOFF & CO.

steel bathtub, which is stamped up from one piece of metal and painted both sides. These tubs are claimed to be specially cheap. They are made at Bischoff & Co.'s factory in Chicago.

THE DAY MFG. COMPANY,

Detroit, Mich., show Day's Instantaneous heater and bathtub combined, in several different attractive styles, one of which to all appearances is a plush-covered couch, another a walnut, cherry or quartered oak wardrobe, but on uncovering an instantaneous water heater appears and a full-sized bathtub, only needing hose connections for the water and gas supply, or gasoline, to be used.

THE MOSELY FOLDING BATHTUB COMPANY,

Chicago, display in a cabinet of hardwood finish with a handsome plate-glass mirror their folding bathtub as it appears when not in use. On lowering the front the bathtub comes in view, as well as their apparatus for heating water, so that the hose connections for supplying the water and gas (or gasoline may be used) are all that are needed to enjoy this modern convenience in a desert.

M'CAMBRIDGE & CO., LIMITED,

Philadelphia, attract the passer-by to an elaborately fitted modern bathroom by a handsome front to their rooms, which are covered with a rich moquette carpet and lighted by electricity. One side of their reception room is provided with easy chairs for their guests, while the wall on the other is used to display handsome water closets, urinals and lavatories, fitted up with nickeled or gilded pipes and flushing tanks with nickeled trimmings or carved decorations. The special feature is the bathroom.

THE STRONG-BOYCE COMPANY,

Indianapolis, Ind., make a fine showing of the Strong water closet, the feature of which, the flushing tank, is hidden or may be in another part of a building away from the closet. The closets are shown in four different styles, from the plain to the handsomely decorated. They set on marble slabs, on a tile floor, and against a wall that is partly tiled with a colored tile border, the upper part being covered with linerusta-walton.

The Rundle-Spence Mfg. Company.

The Rundle-Spence Mfg. Company furnish an example of what can be accomplished by merit, push and fair dealing in their rapid growth to a large producing capacity, which is continually taxed to supply the demand. Located in Milwaukee, Wis., they have a large five-story building on Second street, and a foundry a short distance away. The first floor of the Second street building is used for private and business offices, a fine showroom and a large shipping department. The showroom is filled with plumbing fixtures of the latest design and highest grade. The space is divided by a center and two side aisles, and contains a fine display of bathtubs of wood fiber, steel clad, copper lined and enameled iron, the latter in different styles of elegant finish, with samples of both sitz and foot baths, all furnished with handsome nickel-plated fixtures. On the other aisle are arrayed laundry tubs of slate, ceramic and brown Yorkshire ware and slop sinks, all set up exactly as they should be in use. On one side at the end they make a show of their Iroquois water closets, with flush tanks, and their newly patented back, nickel plated, which makes a neat finish against the wall at the seat. Urinal stalls in both slate and Tennessee marble and a water closet enclosed in Tennessee marble show the plumber what the house can furnish in this line. On the opposite side is a fine array of lavatories, with handsome fixtures and decorated basins, one in onyx, that is particularly noticeable, and others in marble of different colors. The upper part of the walls display a fine exhibit of basins of different color, shape and decoration, tastefully arranged. In the front, which is one large glass window, is a Rider gas engine, some pumps, and enough attractive goods to bring the passing plumber inside to secure further information. A long table in front of this window displays many of their specialties, all nickel plated, including soap trays, sponge racks, air chamber on basin supply, stall legs for urinals, model supply and waste for baths, brackets, all of which they make in their own shops. The second floor is largely devoted to porcelain goods and general stock. The third floor has the brass-finishing shop and nickel and polishing plant. On the fourth floor is the machine shop for iron work, and the back half is devoted to storage of pumps, bathtubs and some special porcelain goods. The fifth floor is a large brass foundry, with its core-makers and ovens and furnaces. Having these manufacturing facilities directly under the eye of the office, with the shipping department in the same building, an order seldom remains long unfilled.

Across the river, a few blocks away on the railroad, is their iron foundry for making soil pipe, fittings and sinks, besides the many other cast goods the plumber requires. Features of their fittings are their length and the large sweep of all bends. A uniform thickness and a smoothness of surface is claimed for their pipe and sinks especially. The foundry is 100 x 150 feet, and runs as smoothly as clockwork, by providing good patterns and materials and pursuing a generous course with all employees. The core-making machines for making cores from 2 up to 12 inch diameter are of their own construction, modified from designs in use, but are to be supplanted by a different machine of their own design which the house has under consideration. The location of the rumblers, cleaning room, grinding shop, coating pots and warehouse is so arranged as to require the least expenditure of labor in handling the product of each day's labor, and storing it in the warehouse, which is three stories and cellar, 35 x 130 feet. The iron, coal and coke are delivered at convenient points from the freight cars, and on an independent inclined railway cars are drawn directly to the cupola house, to be convenient for charging.

A peep at the foreman's books shows that the percentage of loss is small. Both of the leading spirits of the company are practical plumbers who earned a reputation for good work, and this experience has been no small factor in their success, as it enables them to comprehend the needs of the trade and meet them promptly. With the growth of their business the demands made upon them for information keep Edward O. Geran, their consulting and hydraulic engineer, busy studying advanced methods and giving instructions about the setting of plumbing goods made by them. The fixtures in the Hotel Pfister, an exceptionally elegant hostelry, were selected from their stock, and the fixtures in the Wisconsin Building at the World's Fair will enable the plumber who did not attend the recent convention to see some of their regular stock goods in use.

Reports of State Vice-Presidents.

We print below reports of the State vice-presidents read at the convention of the National Association of Master Plumbers last week in Milwaukee. The following reports are in addition to those presented in our last issue:

Pennsylvania.

BY J. L. M'SHANE.

I herewith submit my report from the State of Pennsylvania, which you will find very brief owing to my inability, on account of business, and not having sufficient time to give association matters the necessary attention. However, I made a special effort to let the master plumbers of our State know that we had a National Association. I sent to all of them an invitation to come here to Milwaukee and join us. I mailed to nearly every master plumber of the State (in all about 800) the following circular:

OFFICE OF J. L. M'SHANE,

State Vice-President of the National Association of Master Plumbers, 19 Seventh avenue.

PITTSBURGH, April 26, 1893.

DEAR SIR: In conformity with the progress made in other States I am anxious to receive the co-operation of all master plumbers of our State to the end that we may perfect a strong State organization and have each city and town represented at the next National Association, to be held in Milwaukee in June.

With this object in view, I would be pleased to have you send me the names of all master plumbers in your city and vicinity, and that you express your opinion as to the possibility of forming a local association there. I suppose you know the object of the National Association is to protect the trade against the manufacturers and jobbers in plumbers' supplies from selling direct to consumers, and to protect our members in their determination not to put up any material unless furnished by themselves. The old Keystone State should stand in the front rank in this respect, and if you will aid in the work we can accomplish our object.

It is the purpose to organize a Pennsylvania State Association at the Milwaukee National meeting, and we would like you to be there to aid that object. The *per capita* tax is but $2 per year, and the trade benefits beyond computation.

Will you kindly write me your views on the matter? Fraternally yours,

J. L. McSHANE.

With each circular sent out I inclosed a copy of the Baltimore resolutions. I received replies from nearly every section of the State, all of which were very encouraging, and I am pleased to say that association matters throughout the State are on the increase. We have five cities of our State represented here, and I am certain that if we accomplish the formation of a State association we will have double this number of delegates from our State at the next annual convention.

Ohio.

BY W. A. KELLY.

As State vice-president of Ohio I herewith beg leave to submit my annual report.

Ohio, as she always has, still continues climbing the ladder of fame, looking out over this country for peace and prosperity, sometimes raising her muscular arms in self-defense and again extending them to the helpless and needy.

Always alert to the vital importance of rigid sanitary laws, she stands to-day one of the leading States in the Union and a section of the spinal column of this National Association. She has passed laws, rules and restrictions that have made her one of the healthiest States in the Union, and the plumbers of Ohio deserve credit for the adoption of a great many of her sanitary laws.

They have, through the adoption of laws governing plumbing, reduced certain diseases 50 per cent. in the last ten or twelve years, which the records of the Health Department will show.

Through the knowledge of the plumber (I do not mean tinker) thousands of lives are saved annually from the scourges of disease.

The plumber's whole thought and study is to dispel all filth and to procure for the people pure air and pure water, which are the most important necessities of life.

Thanks to the life of this association and the work of the plumber, the sanitary condition of this country has been revolutionized in the last decade; and if the good work continues during the next decade, the people will have no reason to fear the terrible plagues of disease that are promised so often.

With this object in view, the plumbers of Ohio are coming together, and at present 18 of the leading cities and towns in the State are thoroughly organized and awake to the great necessity of laws that will protect the lives of the people.

On the 14th of February last the plumbers of the State held their annual convention, and great interest was shown in this direction. Of course, we are working to a certain extent to better our own condition, and by combining in this direction we will soon show the people of this country the great importance of the plumber, thereby demanding of them the respect that to us belongs.

Texas.

BY F. J. MADDEN.

Texas is all O.K.

Illinois.

BY WM. T. GEARY.

I present herewith my report as State vice-president for Illinois:

During the past year local associations have been formed in the following cities:

Peoria, with 13 members.
Joliet, with 6 members.
Rockford, with 4 members.
Evanston and vicinity, with 13 members.

The associations in Peoria and Evanston, and several individuals from smaller towns throughout the State, have been affiliated with the National Association.

Thanks to the able efforts of its officers, the membership of the association in Chicago has also been very largely increased.

Many important questions concerning proper trade protection and other matters have been brought to my attention, and for their solution efforts have been made toward a closer relationship of plumbers in this State, which have resulted in the formation recently of a State association, in which are represented about 20 towns, and from this and the various local organizations much good work for the benefit of the trade in Illinois is expected during the coming year.

Wisconsin.

BY FERD. WITTIG.

I hereby hand to you my report as acting State vice-president of Wisconsin for the unexpired term of my predecessor.

Up to the present time we have not organized a State association, but we have formed local associations in various cities throughout the State, and I hope and trust that my successor in this office will accomplish that which probably may have been neglected in the past.

Missouri.

BY J. W. POWERS.

I beg leave to submit the following report, as vice president of the State of Missouri:

During the last year, by investigation, I find that the local associations throughout the State are in a flourishing condition. I might add with propriety that the association at St. Joseph is undoubtedly one of the most compact and fraternal bodies in the United States. Correspondence with master plumbers throughout the State not affiliated with the National Association has borne no fruit, as I have written to about 30 firms and individuals, setting forth all the possible advantages derived by affiliation, but as yet have received no reply from any of them. By observation, I sincerely believe that the organization of a State association in Missouri, under the jurisdiction of the National Association, would eventually lead to a large increase in our membership. A word for our highly esteemed president, Mr. Sheehan, who has rendered me incalculable assistance in the solution of knotty problems pertaining to the local associations, also in the way of organization.

Minnesota.

BY O. W. HUDRIER.

I herewith submit report as vice-president of the State of Minnesota.

The report I have to make is not very flattering to St. Paul or Minneapolis. I find the Duluth Association holding its own, notwithstanding they had a very stubborn strike last summer. I made several visits to Duluth last year and this. They have a representative here at this convention. I have made several visits to Minneapolis with that good missionary worker, W. E. Goodman of Milwaukee, who succeeded in getting a few good members together, by which they have a delegate here at this convention. In regard to the St. Paul Association, I find it is utterly impossible to get some men that should be members, but who are altogether indifferent to their own interests or any others. The only reason I can give is that they are ambitions for work and want it all to the exclusion of all others, and my opinion is that there are no towns in the United States that need the missionary efforts more than the twin cities of St. Paul and Minneapolis. I have had communications from Peoria, Ill., and Des Moines, Iowa, in regard to the National Association, in answer to which I gave the necessary information

Michigan.

BY WM. H. SULLIVAN.

In April, 1892, the master plumbers of Bay City, with one exception, met and organized. On May 20 this exception became one of us.

Immediately after sending application for membership to the National Association, our endeavors were directed toward the forming of other local organizations in the State. After some persuasion the Saginaw plumbers fell in line. Then came to us inquiries from the other cities of Michigan, and knowing that "In union there is strength," it was with great pleasure we answered these several inquiries with the desired information

In March notices of a State association were sent broadcast through Michigan. In April the State organized. Then local organizations were formed in the cities of Jackson, Grand Rapids, Lansing and Detroit.

In our local we have six members, this including all the master plumbers of the two cities. Among us there exist harmony and friendship. The forming of our association has been an excellent thing for each and every one of us.

To-day we are in a prosperous condition, and we have no desire to go back two years.

Between the jobbing trade and our plumbers things are satisfactory, none that we are aware of having violated the Baltimore resolutions, except by one or two errors.

In conclusion, allow us to say that we are proud to know that we were the first organization of the State, not because it means prosperity for us, but because it means prosperity for every member of the National Association in Michigan.

California.

BY GEO. E. HOWE.

The following report of the condition of the association in California is respectfully submitted:

One year ago, at the time of my appointment as State vice-president, the Los Angeles Association was the only one in good standing in the State. Since then I have induced the San Francisco Association to reaffiliate and its membership has considerably increased. Have also organized new associations in San Diego, Sacramento, Stockton, Oakland, Pasadena, Redlands and Riverside, with one representative at Alhambra.

In Los Angeles, San Diego, Redlands, Riverside and Pesadena, all the legitimate master plumbers are members of their local associations.

Last April I organized the Oakland Association with six members, and it now has 25 firms represented.

In the southern part of the State there is at present no opposition to the Baltimore resolutions, the only firm opposing them having finally indorsed them after three years' refusal, and now appreciate the mutual advantage. While there have been violations of the Baltimore resolutions, the offending firm has satisfactorily adjusted the difficulty.

In the northern part of the State the Baltimore resolutions have not been observed—no positive action having been taken for their enforcement until recently.

At present a few of the San Francisco supply houses have not agreed thereto, but indications are that they will very soon, as fully 85 per cent. of the plumbing business is controlled by members of the association wherever organized.

In the southern part of the State we have good plumbing laws. In Los Angeles we have a practical plumber for inspector, and each master and journeyman plumber is required to pass an examination and register, while in the other cities they are only required to register.

In San Francisco any one can take out a plumber's license, as no examination is required, which is a great disadvantage to the sanitary condition of that city, as there are over 200 licenses issued, with less than 100 firms competent to do the work.

The idea of one State association for California has been considered impractical on account of the extreme length of the State, but if the National Association will permit two State associations, one each for the northern and southern portions of the State, they can be immediately organized.

Previous to this year the master plumbers of California have considered themselves too far away from the National Association to derive any protection therefrom, but the occurrences of the past year and the prompt action of the officers of the National Association has convinced them of its extensive power.

The efficiency and untiring zeal shown by President Sheehan and all the officers of the National Association have placed the California master plumbers under great obligations, which will never be forgotten.

Washington.

BY D. B. SPELLMAN.

It affords me great pleasure to submit to you my annual report as State vice-president of Washington. Our State is very well organized to-day. During the past year we have increased our membership 100 per cent. Local associations have been formed at Spokane and Tacoma, and with Seattle comprise the three principal cities of the State, the small towns associating with these cities and all affiliating with our State and National Association.

I called a State convention of the master plumbers to meet in Seattle on May 20, which resulted in the formation of a State association. Some 40 delegates were present from the following places: Spokane, Tacoma, Seattle, Walla Walla, Yakima, North Yakima, Ellensburg, Port Townsend, Schome, Whatcom, Snohomish. After the regular routine business attendant upon organization we elected the following officers: President, D. B. Spellman, Seattle; vice-president, T. H. Bellingham, Tacoma; secretary, F. B. Cleveland, Seattle; treasurer, Wm. D. Coffee, Tacoma. We adjourned to meet at Tacoma on the first Saturday in May, 1894. After adjourning we assembled at the Arlington Hotel to partake of a banquet tendered to the visiting delegates by

the Seattle master plumbers. On the afternoon of the 21st the delegates were given a trip on Lake Washington.

In Seattle we have a local association second to none in the Union, and are getting along splendidly by working in harmony with one another. All our supply houses have consented to make our members their sole distributing agents, selling plumbing goods to no others. We have a joint conference committee with our Journeymen's Union, and all is harmony with them, their members only working for members of our association, and we agree to hire none but members of their union. For the past two years we have been endeavoring to secure the passage of city ordinances to govern plumbing, and I am happy to state we have succeeded. We now have a city ordinance regulating plumbing and sewerage, and providing for the examination and licensing of plumbers. We have set aside a fund and add to it monthly, for the advancement of the trade and the education of the apprentice.

In conclusion I wish to thank President Sheehan for his advice and support, and the plumbers of my State for their friendly co-operation in forming our State Association, and my colleagues in Seattle for their untiring support.

Washington is in full sympathy with the National Association and sends best wishes for its success.

Plumbing Instruction at the Pratt Institute, Brooklyn.

The Trade School at the Pratt Institute, Brooklyn, which is one of the most interesting features of that great educational enterprise, is an institution which is in many respects a model of its kind. While the branches of handicraft taught are at present limited in number, the instruction given and the general arrangements of the manual training classes are the very best obtainable. Every appliance that can in any way enlarge the scope and promote the efficiency of the instruction is provided. Thoroughness of training is aimed at throughout the curriculum, which is extended considerably beyond the time generally fixed in trade training schools. Usually a six-months course is the limit allowed, but that in the Pratt Institute schools reaches over double that period.

TRADES TAUGHT.

The school forms a branch of the science and technology department of the institute, presided over by Charles R. Richards. It includes classes for practical and theoretical instruction in carpentry, machine work, plumbing and house, sign and fresco painting. Formerly bricklaying and plastering also were taught, but as it was found that instruction in these trades was not in such request as had been anticipated, the space allotted to them has been applied to an extension of the painting department. The work includes both day and evening classes, except in the case of plumbing, in which only evening instruction is at present provided. In the day classes, efficient length of time is had at continuous practice to prepare for practical work at the trades, the hours of session being from 9 a.m. to 5 p.m. on five days of the week, with three hours on Saturdays. The evening classes aim principally to broaden and extend the training of those already engaged in the trades. These are held from 7.30 to 9.30 p.m. on Mondays, Wednesdays and Fridays, and are used principally by apprentices and younger journeymen, who are in daily employment.

PLUMBING CLASS.

The plumbing department, in its general features, offers a fair sample of the methods employed throughout the school. The full course is one of two periods of six months each, beginning each year on October 1 and ending on March 31 of the following year, so that it extends over a period of eighteen months. A unique feature of this class, which is not, we understand, found in any other similar plumbing school, is its connection with the Journeymen Plumbers' Association of Brooklyn, which body co-operates in its direction. At the end of the two years' course a committee of the association examines the members in regard to both manual skill and knowledge of trade methods, and awards certificates to those showing satisfactory proficiency, which certificates, in case of the holder subsequently applying for admission to the association are accepted in place of the examination of like character otherwise required by the Brooklyn Association of Journeymen Plumbers. This arrangement was entered into at the beginning of the last term, and is said to work very satisfactorily.

Applicants for instruction in the plumbing class must by the regulations of the institute be between 16 and 25 years of age. All tools and materials are furnished without charge, but a fee of $15 is payable for each six-monthly term. Two well-known and experienced Brooklyn plumbers, John Todd and George Heath, conduct the course of instruction, which is carried out in a large airy, and well-appointed shop, equipped for about 50 pupils, and which is always fully tenanted during instruction hours. A row of benches runs around three sides of the room, at which each pupil has his own particular division, supplied with a separate gas furnace for melting solder and a drawer holding a complete kit of tools.

COURSE OF INSTRUCTION.

Instruction is both practical and theoretical, lectures being given from 8.30 to 9.30 o'clock every Wednesday evening. The manual work includes the use of tools, preparing wiping cloths, making soil, tinning soldering iron, brass, iron, lead and tin, making solder, soldering seams, making cup joint, over-cast joint, straight-wiped joint, flange joint and branch joint, working sheet lead into bends, traps, service boxes and safes, lining tanks, calking iron-pipe joints and bending with sand and kinking irons.

The lectures deal with the material used in the trade; the proper arrangement of drain, soil and waste pipes; trapping and ventilating the same; supply pipes, boilers, tanks, fixtures and pumps. Charts and diagrams are freely used in the instruction, and the examples of defective plumbing illustrated in the trade journals are frequently studied. Special pains are taken to make clear the principles underlying the plumbing rules of the city of Brooklyn.

The lectures are at times increased in interest by a visit to the Museum of the Institute, where a splendid collection of minerals, ores, and specimens of metals and alloys are displayed, and instruction given in the history, treatment, and general application of those bearing on the plumbing trade.

Some fine examples of the work done by the class are included in the general exhibit of the Pratt Institute at the World's Fair.

In all the classes of the Trade School, including that of plumbing, promptness and regularity of attendance are insisted upon, and continued absence or irregular attendance without adequate cause are considered grounds for permanent withdrawal of the pupil. Although the large majority of the pupils are drawn from the city of Brooklyn, there is no rule by which such are preferred. In fact, several young men now going through the course have come from distant parts of the country, including Washington, Iowa, and other Western States.

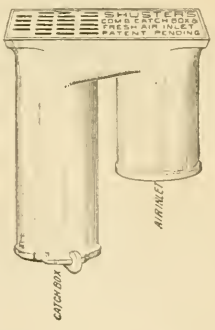
GRADUATION EXERCISES.

The certificates gained by students in the trade school during the past term were presented to them at the graduation exercises of the Pratt Institute, which were held in the assembly room of the building on Thursday evening last. The exercises were simple in character, consisting of prayer by Rev. A. S. Hunt; some excellent music by the Choral Society of the Pratt Institute, and a suitable address by the Rev. J. D. Burrell, followed by the presentation of certificates by Charles M. Pratt, president of the Board of Trustees.

Only three diplomas fell to the lot of the plumbers, those being given to J. B. Hagerty, P. Wallace and W. J. Wallace, Jr., all of Brooklyn. The reason the number was so limited on this occasion is that it is the first since the new arrangement was made with the Journeymen Plumbers' Association, and these three young men were the only ones who had fulfilled the conditions required. Next year it is expected that between 40 and 50 will be ready to graduate from the plumbing class.

Some Plumbing Specialties.

The cut, Fig. 1, shows a combination catch box and fresh air inlet invented and lately put on the market by L. Shuster, Jr., of Franklin and Willow streets, Philadelphia. The inlet ordinarily used is simply a square cap with a perforated top, unprotected, and allowing gravel, small stones, sand and other matter to collect in the trap



Some Plumbing Specialties.—Fig. 1.—Combination Catch Box and Fresh-Air Inlet.

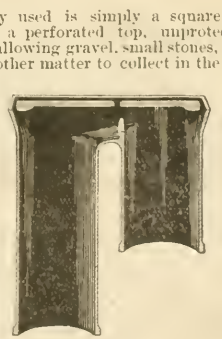


Fig. 2.—Sectional View.

and cause a permanent obstruction difficult of removal. When situated on a curb the ordinary inlet also presents an opportunity for deposit by the ever alert small boy of pieces of sticks and anything else that he can with a

little trouble pass through the holes in the cap. Fig. 2 shows a section of the combination. The catch box leads to the air inlet and has a top graded and recessed in such a way as to make it impossible for anything entering the air holes to pass into the trap, which is entirely covered. The bottom of the catch box has a plate or lid which can readily be removed to allow of the withdrawal of the contents. The combination is especially adapted for use on a pavement; but it may also be used where a pipe leads from a trap in the cellar.

Mr. Shuster is also putting on the market a new reducing Y, as shown in Fig. 3. Hitherto it has been customary

Fig. 3.—Reducing Y.

among plumbers when reducing one size of pipe to a smaller size to use a reducer, which necessitates an extra fitting and lead joint. The use of the new fitting obviates the necessity for a reducer and lead joint and makes a neater and more compact job.

Glycerine in Traps.

From SNIPS, *East Hampton, N. Y.*—What proportion of glycerine is used in water in filling traps in exposed places or in buildings not used in the winter season? What proportion is used in the air pumps connected with gas machines? Is there anything cheaper that will do as well?

Answer.—Inquiry among the plumbers in this city fails to elicit any information in relation to the use of glycerine for traps in unoccupied houses. The filling most commonly used is rock salt partly melted, which does not evaporate. Others use kerosene oil for the same purpose, and a large proportion use nothing whatever. We should be glad to hear from our readers in the matter, and also concerning the use of glycerine in gas machine air pumps.

TRAPS AND VENTS.

IN OUR REPORT last week of the eleventh annual convention of the National Association of Master Plumbers we printed the prize essay contributed by the Chicago Master Plumbers and written by Alexander W. Murray of that city. By an oversight, however, the verses entitled "The National Association," and signed "Orphan Boy," and which came appended to Mr. Murray's paper, were reprinted in a separate column and conveyed the impression that they were a distinct contribution, which was not the case.

GEORGE LLOYD, St. Catharines, Ontario, issues a tasteful little circular illustrating and describing Lloyd's Peerless water heater of his manufacture. The introductory note states that though the heater has only been on the market a short time, it has already proved a success. The pamphlet gives a sectional view of the heater, together with full description and particulars as to consumption of gas, &c. The closing pages are devoted to testimonial letters.

J. J. HAGGERTY, a plumber of New York, entertains some curious notions of suitable hot-weather exertion. Mr. Haggerty jumped off the Brooklyn Bridge one day this week when the temperature was at its highest. He was fished out of the river uninjured, and on being taken to the police station said he had taken the leap "for exercise," and did not mean to kill himself.

MAYOR BOODY of Brooklyn, N. Y., has appointed F. J. Gately and Michael J. Sherlin, master plumbers, and James J. Doody, journeyman, to be members of the Plumbers' Examining Board for that city.

IN THE BUSINESS CENTER of Milwaukee, Wis., will be found the Windsor Mfg. Company—a live metal house with two complete lead pipe making presses right on the ground. They make pipe of all sizes and thicknesses from ¼ inch up to 2½ inches, extra heavy double thick, and soil pipe up to 4 inches. They also make tin pipe, not house conductor, but pipe from pig tin. In addition to this, they make a full line of sheet lead of various widths and thicknesses. They carry solder and Babbitt metals, beside lead, tin, antimony, copper and spelter in ingots and bars.

E. N. SQUIRES dropped in on the plumbers in convention at the Pfister House, Milwaukee, meeting with a cordial welcome. The Dunning boiler is at home in Milwaukee, over 200 being installed and in some of the handsomest residences of the city.

A BILL for the registration of plumbers has passed the Colorado Legislature.

EXPERIENCED MEN, says an electrical contemporary, are needed to do electrical tinkering. There are two in Chicago who are described as "electrical plumbers." Why not? The designation is good, and only electro-mechanics should be entitled to the name.

OLD DOMINION MFG. COMPANY, Sheudun, Va., and 242 Water street, New York, are now manufacturing what they term a bracket board. It is to fasten against the wall over a water closet. Brackets are then screwed to the board for sustaining a water-closet tank. These boards are made of any of the hard woods, as ordered, including ash, oak, sycamore, walnut, mahogany, cherry, &c., in three sizes, the smallest of which is 22 x 20 inches. A vacant space is left, 12 x 5½ inches, which extends partly across the board, thus constituting an air chamber by which, it is said, the noise of the water in the tank is deadened. This company are also manufacturing a urinal tank, with fixtures, having capacities of 1 to 5 gallons. These may be regulated and automatically flush the urinal every 5 to 20 minutes or more, as desired, by means of a noiseless pet cock inside the tank. This tank, it is said, has been simplified, and the cost reduced so as to be within the reach of all. The top is fastened on with screws to prevent being tampered with.

SEALED PROPOSALS will be received at the office of the Supervising Architect, Washington, D. C., until July 19 for the labor and materials required for plumbing, gas piping, &c., for the post office, &c., building at Sacramento, Cal., in accordance with the drawings and specifications, copies of which may be had at the office of the Supervising Architect, Washington, or from the superintendent at Sacramento.

WE ARE INDEBTED to the Toronto Steel Clad Bath & Metal Company, Limited, Toronto, Ontario, for a striking advertisement of Booth's Patent Steel Clad Baths. It is a very heavy card with beveled gilt edges and letters embossed in silver, and a colored print of the bath on a raised panel in the middle. The card is provided with a silk loop for attaching to the wall.

W. EMMET CROSBY, the very efficient executive clerk of the National Association of Master Plumbers, will very probably be continued in that position under the administration of President Daniel J. Finnerty.

THE STEEL BATH MFG. COMPANY, Detroit, Mich., have removed their works to the corner of Wayne and Congress streets, west. The present plant is a five-story and basement brick and stone building 120 x 50 feet, and is equipped with machinery of double the capacity employed at the former works, which will furnish largely increased facilities for the manufacture of the steel-clad bathtub. The new building will also afford, in connection with the above, commodious offices, sample rooms and warehouse privileges.

SEALED PROPOSALS will be received at the office of the Supervising Architect, Washington, D. C., until July 12, for the labor and materials required for the interior finish and plumbing of the United States court house and post office building at Springfield, Mo., in accordance with drawings and specifications, copies of which may be had at the office of the Supervising Architect at Washington, or from the superintendent at Springfield, Mo.

THE CHICAGO BRANCH of the J. L. Mott Iron Works, 311-313 Wabash avenue, will sustain a loss of a few thousand dollars from the water which flooded their basement during the burning of the Adams Building, at the northwest corner of Wabash avenue and Congress street, Sunday morning, June 18. The south wall of the Mott Building received some damage from water, and one of the large plate-glass windows was broken. The timely opening of doors and windows prevented damage to the stock and exhibit in showroom from smoke.

THE WALCOTT-HURLBUT COMPANY, 175 and 177 Lake street, Chicago, have issued an exceedingly handsome supplementary catalogue of 48 pages. It is printed on heavy cream-colored paper, with an illustrated cover of the same. This catalogue is devoted to bathtubs, shower baths, lavatories, water closets, traps, cocks, urinals, &c. The bathtubs cover a variety of solid porcelain baths, porcelain enameled baths and seat baths. Shower baths comprise a combination needle, head and shoulder, liver spray and bidet bath: an improved rain shower with adjustable douche; head and shoulder shower, with appliances for maintaining an even temperature; ring shower, shampoo shower, &c. The closets shown are the Maelstrom syphon jet, the Dececo and the Torrent. The lavatories are four in number, two of which are very ornate, while the others are somewhat plainer yet elegant. Various styles of lavatory supports are shown, also brass traps, pipe straps, lavatory brass supply pipes, spun flanges, the Wrigley self-closing cock, nickel-plated soap cups, towel shelfs, towel racks, brass fittings, an enameled roll rim sink, the Security grease and sewer gas trap, slop sinks and syphon "eduction" closets for schools, factories, &c.

WORLD'S FAIR NOTES.

The Increasing Attendance.

The fair is proving its power as an attraction, and the figures of attendance are climbing up to the huge aggregates prophesied by its enthusiastic promoters. June has shown up remarkably well. In the first 15 days the total number of paid admissions was 1,200,000. That is an average of 80,000 per day. This beats all records in America, and in point of numbers nearly equals the paid attendance of the cheap admission exposition of four years ago in Paris, as it outdoes even Paris in amount of money taken at the gates. This result, compared with the Centennial Exposition attendance, during the same period, will show how great a popular success the Columbian enterprise is.

The whole of June gave the Centennial only 695,000 paid admissions, or but little more than one-half the number at the Columbian in the first half of the same month.

The daily average at the Centennial during the first 15 days of June was less than 27,000, against 80,000 at Chicago.

Already at Chicago during June there have been two days with an attendance far above 100,000 and a third day with a number of admissions but little below that mark, the three days together showing nearly 400,000 paid admissions. During the whole of June at Philadelphia not one day returned an attendance as great as 40,000, and only five days in the month exceeded 30,000.

Not only is the Columbian Exposition showing high figures, but the average is constantly increasing. It is a great, popular movement that gathers momentum as it marches along. The first seven days of the month showed a daily average of 58,500 paid admissions, while the remaining eight days of the half month showed a daily average of very nearly 100,000.

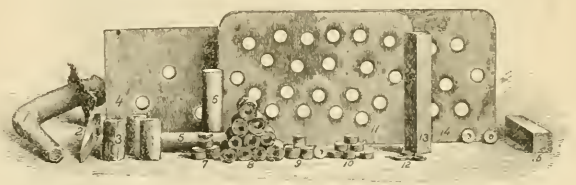
The Ferris Wheel.

The great Ferris wheel, which is intended to rival the Eiffel Tower as a mechanical curiosity, was tested on the 15th inst. At 6.30 p.m. the newspaper representatives and engineer corps of the company who had assisted in the construction, took their seats in the first car. In the second car to pass the landing was a party of ladies. Capt. Robert W. Hunt, president of the Ferris Wheel Company, was in direct charge of the arrangements.

Without jar or jolt when the power was applied, says the Chicago *Herald*, the great circle of steel began to revolve, and though but little was said by the adventurous travelers, it was evident from the expressions on some faces that they would have been perfectly satisfied to have discontinued the trip then. As the car rose and the view expanded, all thought of danger was overshadowed by the magnificent spectacle spread out before them. Midway Plaisance was crowded as never before and resembled a long, black stripe through a field. When half the circumference had been made the cars were brought to a stop at a distance of 260 feet from the ground. Cheers were given by all, and in bumpers of champagne the success of the enterprise was drank. Though the atmosphere was somewhat hazy from the recent showers, the view was superb. Jackson park and its buildings were almost dazzling in whiteness and every outline could be distinguished. Clouds prevented seeing the shores of Michigan or Indiana, but Lake Calumet was clearly outlined. The Hyde Park cribs stood out clear cut like a mirage in the green waters of the lake and the surface of old Michigan appeared to be on a level of the wheel top. In the misty haze a mirage of the cribs could be plainly seen and attracted much attention. After a short stop the journey was continued and in 30 minutes from the time of starting the party had completed the circle, well satisfied with its successful termination. Regular trips of the wheel will be made hereafter.

Punched Castings.

The publication of a series of punched cast-iron plates from iron made by the Thomas Iron Company of Ho endauqua has brought out a similar piece of work, for which we are indebted to Edwin C. Will, foundry foreman of Russell & Co., Massillon, Ohio. The castings were made from coke iron melted with coke and cast in green-sand molds in a horizontal position, the iron being the same grade used always by the firm in question in making their



PUNCHED CAST-IRON PLATES.

engines, harvesting machinery and saw mills. No alloys of any kind were used, nor were the castings annealed in any way. The punching was done on the regular machine without a crack or break. The plates had no supports about the edges and have not been altered or changed since they were punched. The plate, No. 4, was $\frac{5}{8}$ inch thick, while No. 11 was $\frac{1}{4}$ inch thick, and No. 14 $\frac{1}{8}$ inch thick. Nos. 7, 9, 10 and 12 were punchings from these cast-iron plates, 3 inches in diameter. Some of these punchings were $\frac{1}{4}$ inch from the edges of the plates, and since then other plates have been punched as close as $\frac{1}{4}$ and $\frac{1}{8}$ inch from the edge without a crack or break. Nos. 3 and 8 were full-length cuts 2 inches wide and 16 inches long from the hub of a pulley without a break. Nos. 5 and 6 are test bars broken on a Riehlé testing machine, showing 30,000 pounds per square inch tensile strength.

At a final meeting of the Rapid Transit Commission of New York a proposition was agreed upon, which, if accepted by the Manhattan Elevated Railway Company, will secure rapid transit to the city. By the terms of the agreement the company are given the franchises asked for at a gross rental of $175 000 a year, or 5 per cent. on the net income of the company, provided the minimum of $125,000 is accepted. The plan provides for a third track on the Sixth, Ninth and Third avenue lines for express trains, a further extension of the system into the annexed district and other smaller extensions downtown, which may be deemed necessary. While the plan outlined is not regarded as thoroughly solving the question of rapid transit in New York, the scheme is the outcome of over two years' deliberation on the part of the commission.

NEW PUBLICATIONS.

THE SLIDE RULE. By William Cox. 44 pages, size 5½ x 8½ inches, bound in cloth, published by Keuffel & Esser Company. Price 75 cents.

This is the third edition of a well-known work, to which the author has added a full description of the "Duplex" slide rule, an improved form of the Mannheim, which he has invented and patented. Besides clear instructions as to the method of using this valuable instrument, the book contains extensive tables of equivalents for rapid and easy conversion of geometric and other quantities, graphic demonstrations of the working out with the slide rule of some 80 different formulas and practical examples occurring constantly in mechanics, engineering, and even business. The "Duplex" slide rule, unlike all others, has scales on both sides, their arrangement being such that the working out of many complex calculations is very much simplified, while the solutions obtained of certain every-day problems are in a much more convenient form. The work considered as a whole is one likely to prove interesting and instructive, and should be found in the library of trade literature of every wide-awake and progressive mechanic.

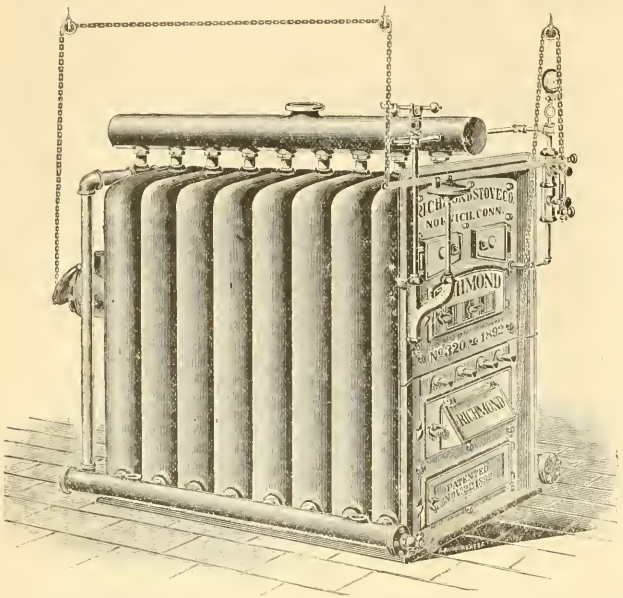
The appeal in the case of the Pittsburgh Reduction Company of Pittsburgh, manufacturers of pure aluminum, against the Cowles Electric Smelting & Aluminum Company of Lockport, N. Y., pending before the United States Circuit Court of Appeals, at Detroit, Mich., was dismissed on the 15th inst. on motion of the appellants for the Cowles Company, at their cost. The patent at issue was the Hall patent, which is said to cover the only commercial method at present in use for the manufacture of aluminum. The patent had been adjudicated and entertained by the United States Circuit Court for the Northern District of Ohio, and the result of this decision leaves the Pittsburgh Reduction Company the only manufacturers of pure aluminum in the United States.

The report of the Bureau of Statistics shows that for a period of 20 months under reciprocity, compared with 20 months before reciprocity, there was an increase in our domestic exports to Cuba of $16,217,552, and an increase of our imports from Cuba of $17,557,470.

STEAM AND HOT WATER.

The New Richmond Heater.

The Richmond Stove Company, Norwich, Conn, have added to their line of steam heating boilers a new design of the Richmond heater embodying certain improvements over the former boiler of the name. A general view of the apparatus, together with detailed views of the sections, as well as a sectional view of the boiler itself, are shown in the accompanying illustrations and present in a thorough way the constructive features of the new heater. The apparatus is adapted to either steam or hot water, the form illustrated being the steam heater equipped with all the trimmings of steam gauge, safety valve, water column, automatic damper regulator, &c. The same boiler without these trimmings is adapted for hot-water heating. The special features of this boiler are secured under letters patent, granted November 22, 1892. As will be seen by reference to Fig. 1, the heater consists of vertical sections connected to a manifold at the bottom of the water legs for the return pipes and similarly connected by nipples to another manifold at the top, which serves as a steam dome for the flow pipe. The boiler is not intended for any casing, but can be protected by a brick wall or asbestos cement if desired. It will be noted in this new form of the Richmond heater that the water surfaces extend to the bottom of the ash pit, and from the



The New Richmond Heater.—Fig. 1.—General View of Apparatus.

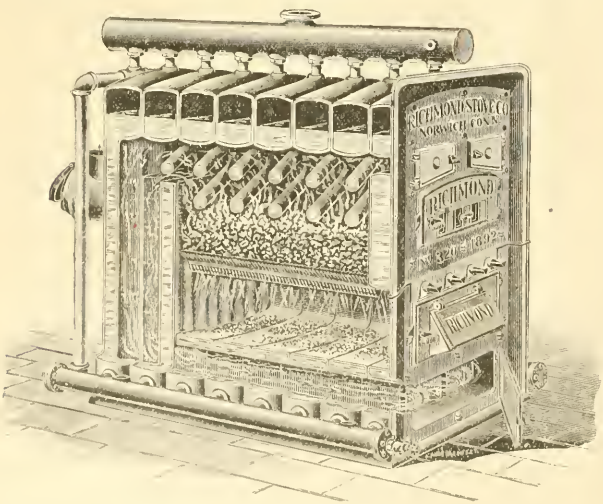


Fig. 2.—Sectional View.

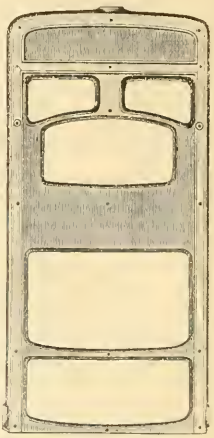

Fig. 3.—Front Section.

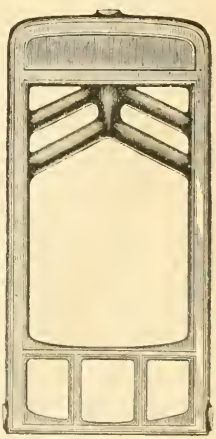

Fig. 4.—Grate Section.

sectional view it will be seen that there are waterways on the bottom of the ash pit to utilize the radiant heat from the bottom of the grate. By a reference to the views of the separate sections it will be seen that a chief feature sought after has been vertical circulation, upon which the manufacturers

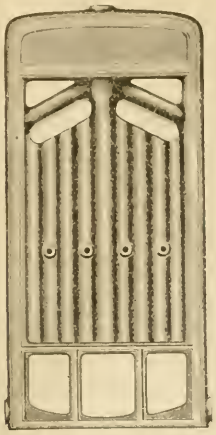

Fig. 5.—Intermediate Section.

lay special emphasis. The same order of fire surfaces is observed in this heater as in the No. 224 Richmond Sectional, a larger heater which was brought out two or three years ago and has met with great success. It has been a special object in the design of this boiler to secure direct fire surface, which is so much more efficient than flue surface. Among the patented features of the boiler is its order of flues.

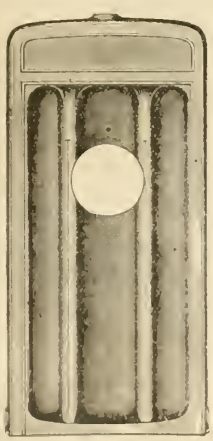

Fig. 6.—Back Section.

The gases of combustion rising to the top or crown sheet, encircle the arms or waterways within the fire chamber, then pass to the rear into the two flues (one at each side) to the base of the heater; thence forward from the horizontal flues to the front, where they unite into one and return into the back and from thence upward into the chimney. The heated gases are thus brought at their highest temperature to the top of the heater, where the water is hottest, and in becoming cool descend another way to the exit, heating the water of lower temperature. The completed boiler is made up of four sections, as shown in the illustrations, Figs. 3, 4, 5 and 6. There will be five sizes offered to the trade, comprising six, seven, eight, nine and ten sections. The six-section boiler will consist of one front, three grate, one intermediate and one back section. Additions to the grate sections will secure the remaining larger sizes, and with each size there will be a corresponding increase in grate area. The width of fire pot is 20 inches, and the length from 21 to 45 inches, increasing 6 inches with each size. The Richmond Stove Company claim a capacity of from 625 to 1225 square feet for the steam, and for hot water from 1000 to 2000 square feet of radiating surface.

The American Radiator Company.

The World's Fair exhibit of the American Radiator Company, 111 and 113 Lake street, Chicago, is now in complete order for inspection in the Manufactures Building, near O-81, the official catalogue number being 883. The company have built a fine pavilion, extending the entire distance from one of the main aisles to another. The ceiling is supported by heavy fluted columns with ornamental capitals, arches springing from one capital to another. The walls are covered with tinted paper of rich design, having a deep frieze ornamented with wreaths and festoons. The pavilion is illuminated by 64 incandescent lights. The display of radiators covers nearly every pattern made by the company, who are recognized as the largest manufacturers of radiators in the world. They operate two foundries in Detroit and two in Buffalo. The exhibit covers circular patterns for columns, dining-room radiators with warming closets, curved designs for bay windows, corner radiators, window radiators, radiators in the form of the letter S, to show the facility with which any curve can be made, direct and indirect radiators, &c. They are also shown in all hights. Some are finished with marble tops and others depend upon the beauty of the molding for their attractiveness. All kinds of finish are represented — bronzed, electro-plated, silvered, gilded, painted in different colors, &c. Single loops are also embraced in the collection, to show more plainly the character of decorations and styles of finish. The space occupied by the company is of such good size that the exhibits are not crowded, but are easily inspected separately. Every visitor to the exhibit is presented with a map of the World's Fair grounds, which is generally very acceptable. A large register is also provided, in which visitors enter their names. It is expected to be an interesting reminder of the fair in future years.

HEATING NOTES.

THE HOWARD FURNACE COMPANY, Syracuse, N. Y., have secured a patent on an attachment for combination heating for hot-air furnaces that possesses certain novel features. The attachment consists of two vertical pipes connected at the lower end by a return bend and the whole hanging directly over the fire. The two vertical pipes pass through stuffing boxes in the dome of the furnace, which arrangement permits the length of the part exposed to the fire to be varied. In this way the heating surface of the boiler can be altered to suit any circumstances. Small variations can be made by simply pulling up the U-tube, the spring of the flow and return pipes permitting this. Where a greater change is desired a short section can be taken out or inserted above the furnace.

A. J. MARTIN, the Philadelphia agent of the Adams Radiator Company of Reading, Pa., is now to be found at 262 North Broad street, Philadelphia.

THE MONITOR STEAM GENERATOR MFG. COMPANY of Landisville, Pa., are sending out a 16-page catalogue descriptive of the Monitor instantaneous steam generator and positive hot-water circulator for heating by steam or hot water. The catalogue contains a quantity of testimonials and a list of the locations of some of their boilers at present in use. C. F. Bachler, the general agent of the company, states that he is placing a battery system of two of the company's boilers in the Cosmopolitan Hotel, at Fifteenth and Filbert streets, Philadelphia.

THE MAGEE FURNACE COMPANY, Boston, Mass., print a pretty catalogue relating to their warm air and hot-water combination heater. The illustrations comprise a broken view of the Magee combination apparatus, as well as a view of the heater set in the cellar with the connecting warm-air pipes and hot-water flow and returns. The hot-water sections are also illustrated in separate views and in detail. Interesting plan views of the method of piping a house by the combination system are also shown. The whole pamphlet is intended as an answer to the broad question, "How shall I warm and ventilate my house?" which interrogation immediately follows the introduction. The front cover of the catalogue is noticeably artistic in its treatment, there being worked into the design an engraving of the first casting made at the Saugus Iron Works, 1642, which is an old iron kettle that was presented to the city of Lynn last year.

SEALED PROPOSALS will be received at the office of the Supervising Architect, at Washington, D. C., until June 27, for removing the old heating apparatus and furnishing all the labor and materials and fixing in place complete a new low-pressure steam heating and ventilating apparatus in the United States court house and post office building at Springfield, Ill., in accordance with the drawings and specifications, copies of which may be had at the office of the Supervising Architect, Washington, or from the custodian at Springfield, Ill.

JOHN DELANEY, Buffalo, N. Y., has assigned to W. F. Wendt and Henry W. Wendt of Buffalo a patent on a radiator, the special feature of which is that each section can be supplied with either exhaust or live steam, as desired. The patent covers a combination of independent radiator sections, provided with passages whereby adjacent sections communicate with each other, and also covers the valves applied to the passages.

ONE OF THE MOST MODERN and complete heating and ventilating plants in the country is to be placed in the Tourist Hotel, Tacoma, by the Baker & Smith Company, 193-197 Van Buren street, Chicago. The building is lo-

cated on a hillside, and is somewhat peculiar from the fact that it is four basements and seven stories high. There will be about 18,000 square feet of radiation required. The same firm are also placing the heating and ventilating plant in the Union Trust Building, St. Louis. About 21,000 square feet of radiation will be used.

WARREN WEBSTER & Co. of Philadelphia, manufacturers of the Webster vacuum feed-water heater and purifier and Williames' vacuum system of steam heating, are erecting a three story brick building 120 x 65 feet at Point and Elm streets, Camden, N. J. The building fronts on the Delaware River, and the site presents ample opportunities for railroad extension and shipping facilities. They will transfer their entire plant to the new building as soon as completed and will supplement it with other machinery adapted to the requirements of their growing business. They expect to commence removal about the middle of July.

Prize Competitions

$25.00.

As announced in previous issues the following competitions are now before our readers and remain open until the dates named:

Prize Competition No. 25.

SUBJECT:

Show-Window Display.

The subject of attractive show-window display is one requiring careful attention as an inexpensive and sure method of attracting and securing trade. This competition is designed to draw out suggestions as to the best methods of displaying goods, which may, if desirable, be illustrated by sketches and photographs. Prominent among the points which may be touched upon are the following:

1. The object of window display;
2. How this object may best be accomplished;
3. Kinds of goods especially suitable for window display;
4. The frequency with which displays should be changed;
5. Treatment of season goods;
6. To what extent goods in operation may be shown;
7. Suggestions for special and unique designs;
8. Arrangement of stands, shelving, &c., in windows;
9. Errors to be avoided in window display.

This competition will remain open until June 24, 1893.

Prize Competition No. 26.

SUBJECT:

To What Extent Are Manufacturers and Jobbers Justified in Selling to Consumers.

This competition is suggested by the fact that frequent complaints are made that manufacturers and jobbers interfere with the retailer's business by selling to his customers. It is intended to draw out the views of the trade on the subject. In discussing the question the following points may, perhaps, naturally be touched upon:

The annoyance and injury to which the retailer is thus subjected;

What the rights and privileges of the manufacturers and jobbers are in this matter;

What it is feasible for retailers to do for their own protection.

This competition will remain open until July 1, 1893.

Prize Competition No. 27.

SUBJECT:

Local Associations of Merchants.

It has been found feasible to form associations in many places for the purpose of securing more friendly relations among competitors and reaching an understanding in regard to matters of common interest. Among the good results referred to as coming from such associations are the following: Overcoming petty jealousies; cultivating a spirit of fraternity; listing of undesirable customers; an understanding in regard to time of presenting bills; putting in operation early-closing movements; agreement as to the prices at which goods are to be sold; mutual accommodation in supplying goods which one merchant may be temporarily short of, &c. The subject is thus evidently a broad one and of a good deal of practical interest. In discussing it the following points are suggested:

Whether it is desirable to have such associations;

How such associations may be organized;

The objects to be accomplished by them.

It will also be of interest to have any information in regard to the practical working of such associations.

This competition will remain open until July 8, 1893.

The following prizes will be awarded in each competition:

First prize.....	$12.50
Second prize.....	7.50
Third prize.....	5.00

The prizes will be awarded for answers which, in the judgment of the Committee of Award, are most suitable for publication and of the most general interest

We reserve the privilege of extending the time on any competition in case the contributions received are not of sufficient number or merit for the committee to award prizes. These competitions are open to every one, and it is hoped that there will be a general response from business men. We shall have the privilege of publishing any or all of the contributions received.

Replies are to be received not later than the dates on which the competitions close. They should be addressed as follows:

DAVID WILLIAMS,
96-102 Reade street,
New York.

Prize Competition No. —.

The committee to whom the contributions in Prize Competition No. 15 were referred have awarded the prizes as follows:

First Prize to T. W. STAKE, New York, N. Y.

Second Prize to R. T. PALMER, Buffalo, N. Y.

Third Prize to E. C. GOULD, Manchester, N. H.

Chicago Sheet Metal Workers.

The following articles of agreement were entered into June 12, between the members of the Employers' Association of Tin and Sheet Iron Job Workers, and the Tin and Sheet Iron Job Workers' Local Union of Cook County, Ill.:

Whereas, It is desired to have a better and fuller understanding;

Therefore, It is hereby mutually agreed that

1. Eight (8) hours shall constitute a day's work, commencing at 8 a.m. and ending not later than 5 p.m.

2. All overtime shall be paid for at the rate of time and one-half. Sunday and legal holidays, viz.: New Years, July Fourth, Thanksgiving and Christmas, or days celebrated as such, double time.

3. The minimum rate of wages shall be 35 cents per hour from the signing of this agreement.

4. One junior or apprentice, at optional wages, shall be allowed for every four tinners or fraction thereof, employed by any one employer, but in no case shall there be more than five juniors.

5. All members of the union sent to work outside of the city by city firms are subject to same rules as while at work in the city, and in addition car fare and board shall be paid by the employer when it is necessary to remain over right.

6. All members of the Employers' Association shall employ as tinners (not including foreman) only members in good standing in the Tin and Sheet-Iron Job Workers' Local Union of Cook County, Ill.

7. No member holding a clear card of Tin and Sheet Iron Job Workers' Local Union of Cook County, Ill., shall work for any firm who refuses to sign this agreement and join the Employers' Association, the city of Chicago and like corporations excepted. From this date no other agreement shall be submitted or renewed.

8. No general strike shall be ordered by any officer of the Tin and Sheet Iron Workers' Local Union of Cook County, Ill., without first submitting the grievance to an arbitration committee of six (6) members, three to be chosen by each party hereto, and in case of a disagreement or failure of a majority of the Arbitration Committee to agree, then the question at issue must be submitted to some one person, to be agreed upon by a majority of the Joint Committee, and his decision shall be final. It is understood, however, that a sympathetic strike on any special building or job shall not be deemed a violation of these Articles of Agreement, nor a hostile act to the party of the first part.

9. Piece work and subcontracting shall be strictly prohibited by members of the union.

10. No changes in this agreement shall be demanded by either party, unless due notice of said change has been duly served in writing by the party demanding the change, and not then unless said notice has been duly served at least four (4) months previous.

The Chilian correspondent of an English exchange reports that a wealthy syndicate are laying down an extensive works in Valparaiso for the production of galvanized corrugated sheet-iron ridging, pipes, gutters, hollow ware, &c. The duty on galvanized iron in Chili is 25 per cent., while the black iron and materials are entered free of duty.

Imports and Exports.

The figures given below show the quantity and value of a few leading lines of imports and exports of merchandise into and out of the United States, as compiled from the latest official Treasury statistics:

IMPORTS.

	Year ending June 30, 1892.		Ten months ending April 30, 1893.		Month ending April 30, 1893.	
	Pounds.	Dollars.	Pounds.	Dollars.	Pounds.	Dollars.
Tin in bars, blocks, pigs, or grain, or granulated	43,908,652	8,667,870	41,833,381	8,465,714	7,446,086	1,467,234
Tin plates, terne plates and taggers' tin	422,176,202	12,315,562	486,777,891	13,651,637	66,498,618	1,821,236
Sheet iron, plate iron and taggers' iron or steel	32,418,322	840,521	76,163,455	1,649,531	10,603,160	221,463

EXPORTS.

Manufactures of tin		225,113		166,088		28,606
Stoves, ranges, and parts of		230,041		178,564		17,118

EXPORTS OF CANNED VEGETABLES.

Year ending June 30, 1892	$373,068
Ten months ending April 30, 1893	220,543
Month ending April 30, 1893	7,607

SCRAP.

According to official reports the tin-plate industry of Germany had almost entirely ceased in 1892. There were produced of this material, in 1888, 18,231 tons; 1889, 22,269 tons; 1890, 21 348 tons, and in 1891, 23,479 tons, all of which was consumed in the country.

A few pots in the tinning department of the new works of E. Morewood & Co., Gas City, Ind., will be put into operation on Monday next. At present the production will be confined to terne plates, with an output of about 2000 boxes weekly. Work on the black-plate mills is progressing actively, and it is expected that four out of the eight will be ready for service before the end of August. Every effort is being made to push the whole establishment to completion as soon as possible.

The British tin-plate trade appears to be duller than that in this country. The following is the latest report from London of tin-plate market on June 10: "Trade is bad, without a doubt," is the report generally made, and even by those who up to a week or two ago held tenaciously to the opinion that matters would soon mend. The South Wales producers appear to be consoling themselves with the heavy shipments that have been made from Swansea; but the consolation does not appear to be very solid or enduring, for, do what they will, makers cannot induce buyers to give the terms asked, nor will they place more than hand-to-mouth orders. Forward supplies are quite neglected.

The works of the American Tin Plate Machine & Mfg. Company of Philadelphia, which have recently been removed to Linfield, Pa., are reported as nearly ready for operation. The machinery is in place and will be started very shortly. The company are owners of Buckman's automatic continuous seaming and tinning machines.

The latest addition to the growing list of American tin-plate manufacturing concerns is one announced from Philadelphia under the title of Black Diamond Tin Plate Works. These works, which are located at 51 and 53 Laurel street, in that city, have been started by Henry W. Scattergood for the manufacture of domestic bright and roofing plates. The manufacturing department will be in charge of Geo. Leyshon and his son, who are well known as practical tin platers. We are advised by Mr. Scattergood that two tioning stacks will be started in operation immediately, having a capacity of 600 boxes of plates weekly, and further facilities will be added from time to time as business increases. The brands adopted for both bright and terne plates are, "Black Diamond" for first-quality and "Leyshon's A1" for second-quality goods. Each plate will be stamped and guaranteed as to quality. The pots used are those on the Leyshon principle.

The tin platers of the Swansea district of Wales are going to put up a Labor candidate for the seat in the British House of Commons made vacant by the elevation of the late member for Swansea to the peerage. Their choice will probably fall on Thomas Phillips, secretary of the Tin Platers' Union, who will specially represent its interests.

The following figures show the importations of tin, tin plates, taggers metal at the port of New York during the last three weeks:

	Week ending June 2, 1893.	Week ending June 9, 1893.	Week ending June 16, 1893.
Tin, block	$234,305	$912,243	$588,954
Tin plates	87,531	71,868	151,813
Taggers metal	24,329	13,598	11,187

Advices from France state that the tin-plate industry, which has been in existence in that country on a limited scale for many years, is about to be extended by the co-operation of English firms, who will import black sheets and tin them at Nantes, where a new works is being constructed. This is being done with a view of avoiding the import duties.

Referring to the opinion attributed, rightly or wrongly, to Secretary Carlisle that the plates made of imported black sheets, but coated in this country, should not be regarded as "American tin plates," nor included in the quarterly returns furnished by Special Agent Ira Ayer, a leading manufacturer of domestic tin plates writes to us as follows: "Nothing was said in the tariff as to the materials that must be used to constitute American tin plate. There is consistency in this, as nothing ever has been said in the tariff as to the materials a manufacturer must use. He uses whatever suits his purpose. It is very silly and betrays intense ignorance of the situation to attempt to deny the use of foreign black plate to an American manufacturer if he wants to use it. Pig tin comes from the East Indies, whether it is used by Welsh or whether it is used by American makers. Palm oil is an essential article in the manufacture of tin plate, and it all comes from the West Coast of Africa, and there is no duty upon it. The product of all these materials is American tin plate if it is made in America. We never heard the word 'American' denied to any other industry merely because some of the ingredients were of foreign growth."

The exports of tin plates and sheets from Great Britain to the United States during the month of May were 26,983 tons, as compared with 31,651 tons during the previous month. The total British tin plate exports show a slight increase over those for May, 1892, when smaller shipments than usual were made to this country owing to the heavy stocks carried over from 1891.

The continuing drought is much felt in the Welsh tin-plate districts, where several mills have been obliged to shut down for want of water. The production of tin plates has consequently diminished, yet no change in prices has occurred. The trade with American markets is reported as dull, but shipments of plates from Great Britain to Russia and other points have been active lately.

The Duquesne Tin Plate Works of Duquesne, Pa., have been granted a charter, with a capital stock of $10,000. The directors are Chas. and Emmanuel Dreifus of the firm of Dreifus, Block & Co., dealers in scrap iron and steel, Lewis Block, Pittsburgh, and Jacob and Isaac Wildberg of Pittsburgh.

With the view of making the exhibit of the American tin and terne plate manufactures more attractive and representative of both the quality of the plates and the handicraft of the American tinner the following offer is made by the American Tin Plate Company of Elwood, Ind.: To any tinner who will make a vase or other ornament or article of tin plate, or to any manufacturing house who will send a collection of articles showing the best quality of tin plate for exhibition at the World's Fair, the American Tin Plate Company will furnish the necessary material from black sheets made in their mill and coated at their plant. A description of what is intended to be made for exhibition is requested with the application for material and a card with the maker's name should be forwarded with any article sent to the fair.

An international fire congress is now being held in London, delegates from all countries of the world being in attendance. It is expected that the exhibition of apparatus and exchange of ideas will result in much good to the countries participating. In this connection it may be interesting to note that despite our finely equipped fire departments—the best in the world—statistics show that the loss from fire in the United States and Canada last year aggregated $132,000,000.

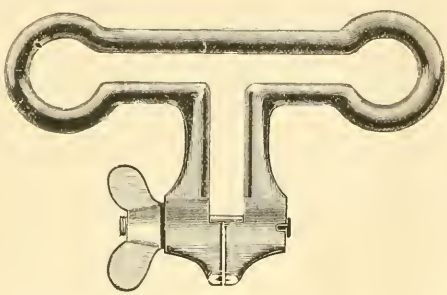
It is stated that the shortage in ten States that yielded at least 250,000,000 bushels of winter wheat last year is estimated at from 75,000,000 to 100,000,000 bushels. The greatest loss is to be seen in Kansas, where the wheat crop last year was 74,000,000 bushels, but where this year it will be necessary to import wheat into that State for seed and bread. The visible supply of wheat, however, is greater by about 40,000,000 bushels than it was a year ago.

The Welch Tap Wrench.

The accompanying illustration is of a tap wrench being put upon the market by T. F. Welch & Co., 65 Sudbury street, Boston, Mass. It is made of steel, and the jaws are regulated by a thumb screw. The wrench is intended for small size taps up to ¼ inch, and the manufacturers claim for it effectiveness and cheapness.

Flexible Metallic Tubing.

In a paper read before the British Society of Arts, Gilbert Redgrave treats of the manufacture and industrial application of flexible tubing. Touching briefly upon the production and uses of rubber tubing and its shortcomings in relation to various industrial purposes for which greater strength than it affords is necessary, Mr. Redgrave passes on to the consideration of flexible metal tubing as being more adapted to modern needs. He enumerates various methods, all falling more or less short of perfection, which have been tried in this line. By the use of coiled wire, either alone in several thicknesses, or in conjunction with a metal strip of some other section, or on what is called the accordion system, wherein numerous thin concave disks of metal are soldered together alternately, on their inner and outer edges, as well as in other ways, flexible tubes have been produced, and almost invariably in conjunction with rubber joints. But, says our authority, "as rubber used in this way is liable to deterioration and decay, we are bound to assume that this is not a joint of a permanently durable character.



The Welch Tap Wrench.

"All engineers are aware that it is no easy matter to produce an absolutely tight joint between two metal surfaces; and for this reason alone most of the earlier efforts to obtain a flexible metal tube were based on the use of some foreign substance to form a packing. This substance was generally a strip of India rubber, and, for the reasons already given, the first flexible metal tubes could not be regarded as otherwise than imperfect from the point of view of durability. The problem of making a flexible tube of metal was found to depend upon the method of coiling a strip of metal in a spiral form round a mandrel or core in such a way that the continuous joint or seam between each coil of the helix was not only perfectly sound, but was also possessed of mobility. In tracing out the steps by which this problem has been mastered, I shall bring before you the so-called flexible metallic tubing, the invention of M. E. Levavasseur."

M. LEVAVASSEUR'S INVENTION.

Mr. Redgrave then describes the inception of the idea by M. Levavasseur, a manufacturer of jewelry in Paris. Some 20 years ago that individual produced bracelets and necklets made of thin laminæ of gold or silver, of tubular form; the tube being built up of strips of metal of two different sections coiled one above the other. A flat channelled section was first employed, and above it came a semicircular clip uniting the two channels together and forming a complete tube. This device became so popular in the form of ornaments, that the inventor obtained a patent for it. Later on he produced jewelry from coiled metal strips, on the interlocking principle, where only one continuous strip is used and the convolutions grip into each other. Some six years since M. Levavasseur hit upon the idea of applying this principle to a wider field. He conceived that by the insertion of a strip of rubber between each scale, making the tube water tight, it might be adapted for many purposes in which the use of rigid, or of rubber tubing was alike undesirable. This idea was forthwith patented, and it has, after exhausted experiments and numerous alterations, now been developed into a flexible metallic tubing, which is claimed to fulfil all the conditions required for such material; but with this important modification, that the use of rubber for jointing has been entirely discarded.

METAL JOINTS.

In Mr. Redgrave's own words:

"Finding, after repeated trials, that it was impossible to produce satisfactory specimens of tubing in which the tightness of the joint was secured by means of a rubber strip, the next stage in the invention was the attempt to manufacture a spirally wound tube in which this might be accomplished by simple interlocking of the coils of metal without packing of any kind. The well known difficulty of producing a sound joint by metal against metal would appear at first sight to interpose almost insurmountable obstacles to success in this attempt, but after further experiments a considerable measure of success was obtained by the use of another section. It will be evident that to roll a thin strip of flat metal into this section it would be exposed to very severe strains, in consequence of the numerous sharp angles, and it is necessary to effect the conversion by slow degrees by the use of a graduated series of molletts through which the metal passes many times. This particular section involves six almost right-angled bends, and the manufacture can only be carried out with a very ductile metal like the best soft iron, copper or brass. The process of evolution to the form of metal strip now employed was a matter involving time and much consideration; and in the latter section packing is entirely dispensed with. In its latest form each metal strip has a comparatively large surface in contact with the one adjoining it, and, by the difference in the width of the two grooved channels, an ample allowance is made for play. This is, in fact, a piston joint; for the smaller corrugation works within the larger one, as the piston works within the cylinder. In the first form of this joint a notch was rolled upon the summit of the lesser corrugation, to receive a thread of hemp, cotton or asbestos, to serve as a species of packing; but in the latest form of the tube the packing has been entirely done away with, and we find nothing but the two metallic surfaces in contact.

"It will appear at first sight to practical men who have had experience in metal work that it would be absolutely impossible under these conditions to produce a continuous sound joint in a tube of any length, even under very moderate pressure, but that it should be possible to obtain by this means a steam-tight joint, or one capable of conveying petroleum oil gas at a pressure of 300 pounds per square inch, will scarcely be credited. Such is, however, an undoubted fact, and the tube is not only perfectly tight under these conditions, but it likewise retains its flexibility unimpaired. The only explanation is that in this form of joint the greater the internal pressure the more firmly are the metal surfaces, which approximately form two sides of a square, brought into contact. There is no possibility of torsion, or, what would be equivalent to a partial unwinding of the tube, because of the friction of the metallic surfaces; and as the internal pressure increases, in precisely the same ratio does the tightness or soundness of the tube increase, until the point is reached when the strain on the metal strip produces elongation or partial deformation of the section, and in the tube ¾ inch in diameter, formed of a coiled strip 0.6 mm. in thickness and 14 mm. wide, this would appear to be reached at a pressure of about 2000 pounds per square inch. There is practically no limit to the size in which pipes of this kind might be produced; it only becomes a question of the mechanical power needed to roll the metal strips into sections and to coil them into tubes. As this is at present effected by one continuous process in a single machine, it will be understood that the production of pipes of large diameter would need a very powerful plant; there are probably, however, but few uses for flexible tubes exceeding from 10 to 12 inches in diameter."

PRACTICAL UTILITY.

In connection with the industrial application of flexible metal tubing, Mr. Redgrave particularly points out that two conditions are necessary, viz: Flexibility, which is possessed in full measure by the rubber tubing; and resistance to external and internal pressure, in which that substance falls short. Metal tubing fulfils both conditions. In regard to the latter we are told that one great superiority of the flexible metal tubing over similar tubes of other material, is its power of supporting a heavy load placed upon it, either designedly or by accident. From experiments specially made it has been ascertained that the various sizes of tubing will support the undermentioned loads gradually placed on 1 inch of bearing surface:

Internal diameter of tube.	Weight needed to compress tube to an oval section.	Weight needed to crush tube.
Inch.	Cwt.	Cwt.
5-16	15	27
3/8	10	27
1/2	13	31
5/8	13	35
3/4	18	42
1	18	49

A tube lying on the floor can thus be trodden upon with impunity, indeed a

cart might almost be driven over it and this feature aloue is of the utmost importance when the question of the use of gas is considered. It is also stated that the metal tubing is capable of resisting an internal pressure of 2500 pounds to the square inch.

In addition to this point of superiority, possessed by metal tubing over rubber, is its capacity for withstanding without injury, an increase of temperature that would entirely destroy the rubber tube. It will not kink, moreover, and is therefore recommended for use for the transmission of air in diving operations. On board ship, too, it may be adopted with advantage in place of rigid tubing, which is often fractured and rendered leaky by the straining of the vessel. The new tubing is not liable to damage by frost, which fact opens out a possible use for it in plumbing work of many kinds.

USES TO WHICH ALREADY PUT.

Mr. Redgrave concludes his paper by enumerating some of the purposes for which the flexible tubing has already been employed. He remarks that "it has been used to convey air under pressure for driving rock drills and boring machinery. It has been found perfectly steam tight, and it was employed at the recent Royal Naval Exhibition to carry steam at pressures ranging up to 200 pounds per square inch. It is, however, quite capable of resisting under actual working conditions much more severe tests than this, for a considerable quantity of the flexible tubing has been supplied to one of the leading railway companies to carry petroleum gas from the reservoirs to the carriages under a pressure of, in some cases, 300 pounds per square inch. The tubing has also been applied with complete success to the pumping of petroleum oil, a liquid which has a peculiarly subtle power of penetrating joints of every description, and which furnishes a specially severe test for a flexible tube of this nature. In the manufacture of varnishes, in jam making, in various brewery operations, for the suction pipes for publicans' beer engines, for organ-blowing purposes, for carpet beating machinery, and for speaking tubes the new tubing has been used most successfully. An extensive field of usefulness can be predicted for this invention when employed for covering insulated wires for telegraphic and telephoning purposes. I have here some specimens of small cables sheathed with the tubing. It would be practically impossible to crush it or to injure it by friction in the ordinary way, which points to its use for the shore ends of cables. The cheapness of this mode of manufacturing the armored wire would be greatly in its favor. The tubing has been proved to be most valuable in lighthouses for supplying the oil to the wicks, which, as is well known, are moved by automatic machinery, and need a permanent flexible connection with the oil vessels."

In regard to price, we are told that it compares very favorably with that of similar tubes of rubber, to which it is undoubtedly superior in strength and durability.

The Stirling Packingless Valve.

The Stirling packingless valve, as shown in the engravings, has been in continual use for over two years at the Philadelphia Shafting Works of Geo. V. Cresson Company. The sizes used vary from an 8-inch throttle-valve on the main engine to the ½-inch for various purposes of steam and water throughout the entire works. During the entire period of their use the valves have received no attention or repairs of any kind, and yet they are absolutely free from leakage around the stems and work as freely as when new. The large engine is very highly finished and is kept bright and clean; the throttle valve, therefore, is not only made to correspond in point of finish, but it must also be absolutely free from leakage around the stem, as but very few drops would seriously mar the immaculate appearance of the bright work located directly under the valve unless some provision were made to receive the drip, which is not the case. As may be seen by reference to the illustrations, the self-packing device is extremely simple and may be used with any style of disk or gate valve in which the opening and closing are effected by rotating the stem, no matter what the resultant motion as regards the valve proper may be. The body or case D is of the ordinary pattern, as are also the valve seat G and face A. Upon the upper side of the disk, however, there is a hexagonal sleeve, *a a*, Figs. 1 and 2, which is threaded internally to receive the corresponding screw *b* of the valve stem. The sleeve is made to fit freely into a female hexagonal bearing in the part C of the body, which acts as a guide to the valve and also prevents its turning with the stem in opening and closing. The valve stem B is made with an enlarged diameter, b^2, which gives large bearing surface and is also rendered necessary to enable the hole to be of sufficient size to permit the passage of the screw *c*, it being inserted from the inside. Below the bearing b^2 is the angular enlargement b^1, working against the conical bearing c^1, with which it is ground to form a steam-tight joint. The collar, or washer, *e*, Fig. 3, is seen to have a segmental projection in the hole, which is seen to fit upon a corresponding flat on the valve stem. The nut *d* is made to fit snugly on thread *c*, to hold it in position without the use of a jam nut. The adjustment of the stem is made so as to allow perfectly free motion of the stem between the collar *e* and the cone b^1.

We will suppose the steam to be admitted in the course of arrows, Fig. 1, and the valve closed. By revolving the stem to the right, the left-hand thread *b* screws into the valve and permits the pressure to raise it from its seat. At the same time the conical bearing on the stem is pressed against its seat c^1 and forms a self-acting valve to prevent leakage around the stem beyond that point. If for any reason it is desired to reverse the direction of admission so as to have the pressure on back of valve when closed, the slight play in the thread *b* will permit the necessary contact at c^1 to prevent leakage, while the valve proper is also held to its seat by the pressure on its back.

In the first position, it is obvious that even if the valve should leak there could be no escape past the stem, as even a moderate pressure by the screw on the valve would cause the packing valve, as it may be termed, to become perfectly tight. If the leakage through valve were considerable of course the accumulation of pressure on the back would be sufficient to act on the packing valve in addition to the pressure from screw. As there is the entire area of the large end of the seat c^1 exposed to the unbalanced pressure above the valve, it is obvious that there is very little possibility of leakage from the firmness with which the two surfaces are held in contact. As to the durability of this portion of the device, the fact of its remaining in good condition after two years' service enables it to speak for itself. Any information regarding the valves can be had by addressing Antonio C. Pessano, general manager, Geo. V. Cresson Co., Eighteenth street and Allegheny avenue, Philadelphia.

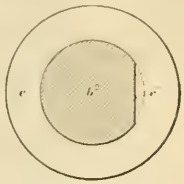

Fig. 3.—Section at A'.

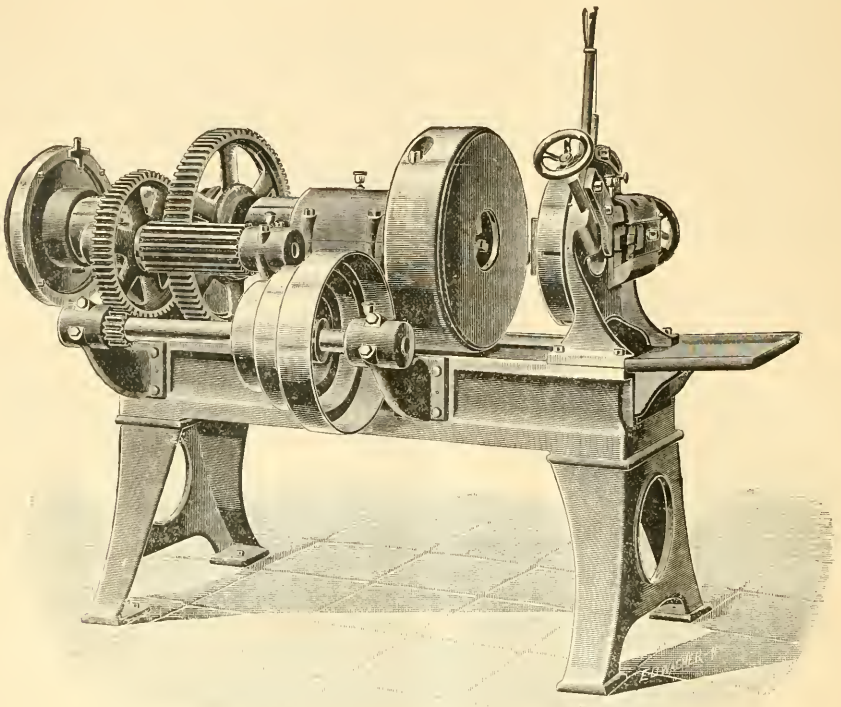
THE STIRLING PACKINGLESS VALVE.

Pipe-Threading Machine.

The Eaton, Cole & Burnham Company of 82 Fulton street, New York, make a pipe-threading machine which has countershaft and cone pulleys for regulating the different speeds to suit the size of pipe to be cut, and is furnished with adjustable dies. The die head, with its cutting off attachment, is firmly bolted to the bed, thereby insuring the proper position of the dies. This die head is arranged with concentric chuck by which the dies are easily adjusted and thrown in or out of position at the will of the operator, by simply grasping the lever handle shown in the engraving.

The concentric chuck shown has three steel jaws that are actuated by an eccentric ring, making the chuck at once powerful and convenient. This chuck is attached to a long hollow spindle, through which the pipe passes, and having a suitable centering arrangement at the back end. The spindle handle has long bearings of large diameter, and is easily moved backward and forward, carrying the pipe with it, being driven by the long pinion upon which, it will be observed, the large gear wheel slides. This machine will thread pipe from 1 to 4 inches in diameter.

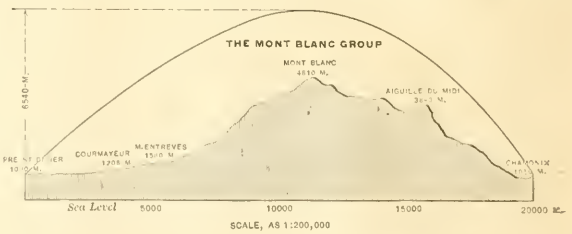


EATON, COLE & BURNHAM PIPE-THREADING MACHINE.

In a late report the British Consul at Batoum places the total output of Russian petroleum wells in that district for last year at 5,491,970 tons of crude oil, averaging a daily yield of 15,045 tons. On December 31,299 wells were producing, and the number is increasing. Petroleum to the value of $14,254,416 was exported in 1892.

The Trajectory of a Modern Gun.

An excellent illustration of the power of modern ordnance is given in the catalogue which the Krupps of Essen have issued concerning their exhibit at the World's Columbian Exposition. The 9.45 inch coast gun, which is 40 calibers long and weighs 31 metric tons, is so mounted that it can be fired at an elevation of 44°. With a projectile weighing 474 pounds and a powder charge of 253 pounds, an initial velocity of 2099 feet was obtained, and with the maximum elevation of 44° the projectile was hurled a distance of 65,616 feet at the Meppen proving grounds. In its flight the projectile reached an altitude of 21,456 feet, its flight occupying 70.2 seconds. This is reported to have been the greatest distance fired thus far by any gun with an equal weight of projectile. As the accompanying illustration shows, the projectile would clear Mont Blanc, and that it would be possible to fire over that mountain from Pré St.-Didier.



Distance, 65,616 *Feet.—Elevation*, 21,456 *Feet.—Hight of Mont Blanc*, 15,781 *Feet.*

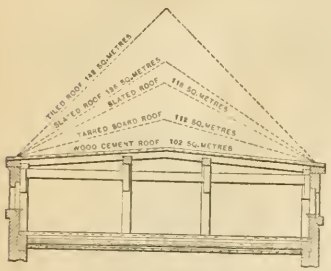
THE TRAJECTORY OF A MODERN GUN.

The agitation in New England for the nine hour working day is extending to all branches of industry.

ROOFING AND CORNICE.

Wood-Cement Roof.

In the accompanying illustration is presented a section of a building showing various roofing methods and their superficial contents in comparison with what is known as Haeuster's wood-cement roof, the latter being a new form of covering which has gained the approval of the authorities and other competent persons in Germany. It has also been frequently employed in Austria, Russia, Holland, Belgium, and especially in France. The rafters and covering being arranged in an almost horizontal position reduces the area of the roof to a minimum, and therefore results in a saving both in the amount of material required and in the labor of putting it in place. The rafters, however, must necessarily be somewhat



TILED ROOF 148 SQ.METRES
SLATED ROOF 135 SQ.METRES
SLATED ROOF 110 SQ.METRES
TARRED BOARD ROOF 110 SQ.METRES
WOOD CEMENT ROOF 102 SQ.METRES

Wood-Cement Roof.

stronger than in the case of ordinary roofs. One advantage of the wood-cement roof, so it is claimed, is that it can be used as a bleaching or drying ground, flower garden, open-air restaurant, playground for children, or for any agreeable, useful or profitable purpose, as it admits of constant use without sustaining injury. It is also stated that the temperature below a wood-cement roof with a layer of gravel or a plot of grass is in summer and winter more uniform than under any other roof. Disturbing noises caused by high winds, heavy rains or snowfalls are also avoided. The construction of the roof is said to be such that rain water can easily be drained off by arranging the slope of the roof in the middle and collecting the water in tanks for domestic or industrial purposes, or it may be carried off by means of conductor pipes of ordinary construction. This form of roof is, we understand, being introduced into England, and trials which have been made with it are said to have proven very satisfactory.

New Steel Roofing Seam.

A new construction of roof seams, as shown by the accompanying cuts, has been secured by letters patent of late date to the Decatur Steel Roofing Company, Decatur, Ill. The object of this invention is to secure a cleat fastening that will engage with the roof seams, holding the seams firm and secure without being exposed and without the use of rivets, eyelets, tongues, or any part of the cleat showing on the outside of the seam. In addition, it will be noticed that the roof seam is double fold at every point of cleat fastening, giving it the advantage of strength and security, yet doing

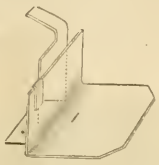


Fig. 1.—Showing Cleat.

away, it is pointed out, with one-half the work with seamers required on a double-fold roof. The manner of forming the seams by this improved method is clearly shown by the cuts, except that the projecting strip on the cleat, as shown in Fig. 1, is not used unless it is desired to lay the entire roof before seaming, in which case the cleats are

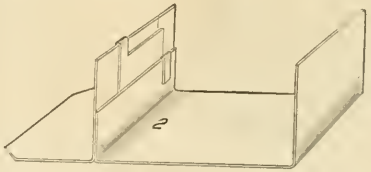

Fig. 2.—Showing Cleat and Sheets Edged.

furnished in the form as shown, and the strip is folded down over the high edge, the lower strip being folded over the 1-inch edge, holding both edges secure until the workman is ready to form the high edge over the lower, completing the seam. The material used for this roof is steel. The sheets are inspected and painted on both sides, after which

Fig. 3.—Cleat Turned Down and Finished Seam.

they are joined by a double-lock cross seam, and, if not ordered otherwise, are wired in rolls of 100 feet long, containing enough material to lay slightly over two squares.

FLASHINGS.

The Cortright Metal Roofing Company of Philadelphia and Chicago are calling the notice of the trade to their patent improved valley, heretofore made with one fold on each side to which the slates or shingles were attached. The improvement consists of an extra fold on each side, thus forming double protection against driving storms. The folds provide amply for expansion and contraction of the metal. While this valley is especially intended for use with their metallic tiles, shingles, &c., yet it is also used extensively with wood shingles and slate. It can be supplied in any weight of copper or brand of roofing tin.

The Fresno *Morning Republican* of recent date makes pleasant reference to John C. Dressel of Fresno, Cal., and mentions the fact of his having received the second prize in *The Metal Worker* skylight competition. The item also makes complimentary reference to *The Metal Worker*.

A novel use has been made of the telephone by the police authorities of Newcastle, England. Each constable carries about with him a telephone that consists of a combined receiver and transmitter. In the case of his requiring to communicate with headquarters he attaches the telephone to the alarms that are set up every here and there, and immediately he is in touch with the officer in charge. The system is of special advantage in cases of fire.

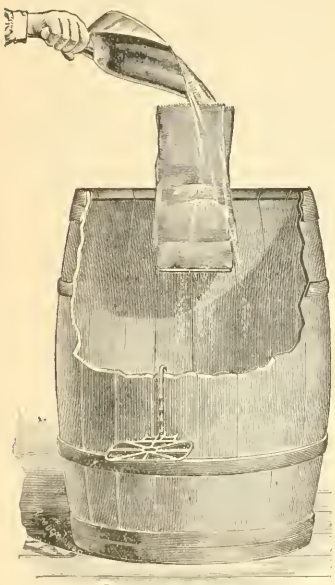
A British foreign office report on labor in Germany states that working hours in Berlin are from 12 to 17 a day. In many districts in the Fatherland adults are said to earn no more than 25 cents a day; and 60 cents is a high wage, even in Berlin. The average income of all skilled trades in Germany is less than $150 a year.

Brooklyn (N. Y.) property owners have taken a decided stand against the further extension of the trolley system in that city.

THE RETAIL STORE.

Edgerton's Hanging Shelf.

The accompanying cut shows a hanging shelf put on the market by C. W. Edgerton, Bristol, Conn. The shelf is about 7 inches square and the hanger 9 inches long, nicely japanned, and shown suspended on the barrel. The hanger, which is provided with notches, passes through an opening in the shelf by which the shelf can be adjusted to various hights. In operation the hanger is placed over the edge and inside the barrel containing flour, sugar, &c., and on the shelf the paper bag to be filled is placed, as shown at

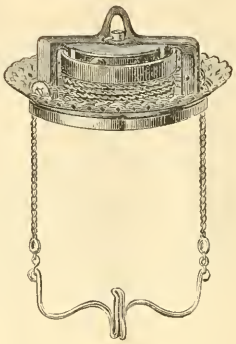


Edgerton's Hanging Shelf.

the top of the cut. As the article in the barrel is lowered the shelf is let down on the hanger to a convenient hight for holding the bag. The manufacturer claims that the device saves time, that the bag is in the most convenient position possible, and that everything spilled goes into the barrel instead of on the floor or counter.

Gravity Extension Fixture for Lamps.

The Plume & Atwood Mfg. Company, 18 Murray street, New York, are offering a gravity extension fixture, as here illustrated, having a ball stop. This device is intended to be attached to a hook in the ceiling for suspending hall or other lamps, and permits of the lamp being quickly and readily taken out for cleaning or refilling without the fixture springing back when the weight is removed. It can be drawn to any point and held and as easily released. The fixture in position is ornamental in appearance, the mechanism being concealed by a metal disk 7½ inches in diameter formed in a die. Above this disk is a cast-iron drum, grooved so that the chains after passing over wheels are taken up by the drum, which is actuated by a spring. The



Gravity Extension Lamp Fixture with Ball Stop.

locking contrivance consists of a cast-iron ball ⅝ inch diameter rolling back and forth in a wedge-shaped channel. To elevate the lamp it is swung slightly to one side to release the ball, when the lamp is gently lifted and the chains wound up. When the lamp is to be lowered it is pulled down to the desired position and lifted a moment until the ball rolls into position, thus locking it. From eye to hook the extreme length is 4 feet. The fixture is supplied in brass or brass nickeled.

The Wayne Barrel Truck.

Wayne Oil Tank Company, Fort Wayne, Ind., are introducing the truck illustrated in the accompanying cuts. The truck is designed to obviate the

Fig. 1.—Truck Ready for Use.

necessity of platforms on which to place barrels while on tap; the barrel being loaded can be pushed to any portion of the store or under a counter, and there remain on tap until the barrel is empty. The handle is removed when the barrel is placed in the desired location, as in Fig. 3; where several trucks are in use

Fig. 2.—Barrel Loaded.

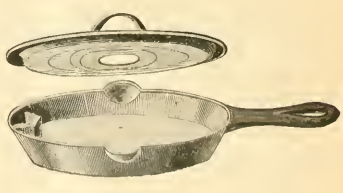
only one handle is necessary. The manufacturers also make a drip pan to place under the faucet, to catch the

Fig. 3.—Barrel while on Tap.

overflow or drippings, keeping the surroundings neat and clean.

Smokeless Frying Pan.

W. E. Beveridge, Baltimore, Md., has secured a patent for, and intends placing on the market, what he describes as the Smokeless frying pan, a general view of which is shown in the accompanying illustration. The pan is made with a lip at both sides, and provided with a close-fitting cover. An important feature is the opening in the lid and in the body of the pan itself, which is claimed to create a draft that



Smokeless Frying Pan.

serves to carry away all unpleasant odor which may result from cooking, and prevent its finding its way into the house. The pan is being made in three sizes.

Suggestions as to Improvements in Putting Up Goods.

SECOND ARTICLE.

BY J. E. BACKENS.

This subject is one presenting a wide field for inquiry and investigation. It must be admitted at the outset that the improvements in the putting up of goods have been very marked during recent years: one has to search much more closely now than formerly for shortcomings. Probably in no country has this matter received as much attention as has been given to it by Hardware manufacturers in the United States. Still there is room for improvement, as I will endeavor to point out by considering the subject in its different aspects.

STRENGTH OF PACKAGES.

Many goods are put up in pasteboard boxes, which are too weak to hold them; this is notably so with heavy articles, such as Hammers, Hatchets, Pincers, &c. In some cases Nail Hammers are being put into wooden boxes, but in my opinion Hatchets require such boxes even more than Hammers. The edge of the Hatchet has a tendency to cut through at the angle of the pasteboard box, as the article is one frequently handled in a retail establishment, and the edges sticking through soon cut into and mar the shelving. In Pein Hammers, I venture to say, very few retailers ever get a box of the larger sizes that is not broken. In drawing these out of the shelf, as soon as the bottom of the box becomes weak they drop out at the heavy end. Of course it could not be expected to have the cheaper grades of these articles put up in slide-cover boxes.

THE SIZE OF PACKAGES.

As far as the quantity is concerned good judgment is very generally displayed; but the size of the box is frequently too small to contain the articles after they once become slightly disarranged. Perhaps there is a good argument in favor of having bulk and weight at a minimum, but I think it is slightly overdone.

PACKING OF GOODS.

As a rule care and system are noticeable in this direction, but there is room for improvement, particularly in the packing of Locks and Trimmings. While much progress has been made in the style of package, and the separate boxing of Locks and Knobs, it still remains a general custom to place the Screws "at large" somewhere in the box. The Locks, Escutcheons, &c., are wrapped in a light quality of paper; through friction and otherwise the Screws get loose in the box and too often turn up partly missing, having escaped through a crack in the edge of box, or perhaps dropped out in examining at the factory and overlooked. I have experienced this same trouble with expensive bronze front door and store door Locks; these being large and heavy the boxes do not always reach the retailer in perfect shape. If Screws are short, he cannot replace them, because retailers do not carry assortments of the various finishes of Screws in stock. Now, to remedy this, how simple it would be to place all Screws for each Lock in a stout manila envelope and seal it. That would prevent the scattering of Screws, which will work out of the smallest opening; the envelope would not be overlooked, and would obviate the necessity of counting the Screws when selling a Lock.

LABELS.

This is an important feature on certain lines of goods, particularly such as are not usually sampled and placed in drawers. The usual fault of labels is that they are too uniform—not sufficiently distinctive. That which should receive prominence is frequently overlooked. Take, for instance, Cabinet Locks. These are usually sold from sample and listed by number, the number consequently is the part that should have prominence on the label. Some manufacturers have "caught on" to this, as shown by the labels reproduced in Figs. 1 and 2.

The advantage of these labels will be at once apparent to those who have experienced the difficulty at times of finding the desired number or size amid an assortment of goods of the same line. It will be noticed that additional numbers are also given corresponding with two other makes of Locks, thus covering the three makes most commonly found in jobbers' stocks. In Door Locks the same suggestions will apply: if it is a Mortise Lock, the word MORTISE should be extra prominent, or the number may be given prominence, as in Fig. 3.

SCREW DRIVERS.
Patented May 15th, 1877, and April 29th, 1879.

Fig. 4.—Black on Green Paper.

No. **86** 1-2 Doz.
SCREW DRIVERS,
Manufactured by the Stanley Rule & Level Co., New Britain, Conn.
4 INCH.

Fig. 5.—Black on Blue Paper.

Applying the same rule, for instance, to Screw Drivers, it will be found that the point to be emphasized is the length. The labels, Figs. 4 and 5, show by contrast the significance of this suggestion. Providing for space for marking cost and selling prices on a label I do not recommend. The ordinary green label cannot be plainly marked in pencil, besides the cost and selling marks should be distinctive, and that is best accomplished in using a separate label.

SHORTAGES IN COUNT

or weight are of rare occurrence so far as my experience goes. With few exceptions there seems to be constant progress noticeable in the putting up of goods: in some cases enterprising jobbing concerns have led the way to certain reforms or improvements, by having goods specially packed for them. The vast extent of the territory over which most of the articles of Hardware are shipped, requiring extra handling and perhaps repacking, are alone sufficient reason for permitting no relaxation of efforts toward further improvement.

Waste in a Store and How to Avoid It.

THIRD ARTICLE.

By G. B. Korbett.

A careful business man tries to avoid wasting anything useful, as much as possible, not merely alone for economy's sake, but also from principle. It is wrong to let any substance, whatever it may be, go to waste, instead of turning it into use. Careful husbandry means to apply everything to its proper use, and is therefore the source of order, and without order there can be no success—no lasting one anyhow. A careful salesman will, without showing any niggardly disposition, do all he can to turn everything into use, and never forgets that the smallest sales are the ones which naturally bring the highest percentage of profits; purchasers who have any common sense do not expect it any other way. It would therefore be foolishness not to charge for trifles out of a false sense of liberality or chevalierly impulse. There are exceptional cases, though, where a certain display of liberality is well placed. It is a safe rule to remember, notwithstanding, for everybody who tries to make a living by selling merchandise, that goods are kept in store to bring financial returns and not to be given away as little tokens of friendly feeling.

WEIGHING AND MEASURING.

In weighing or measuring articles which you sell you must be just, but need not be liberal. To do so it requires some skill, as it looks very mean if you make your efforts at strictness too noticeable. A salesman who takes out a few nails to drop them back again, and maybe repeats this, gives the impression of trying to treat his customers rather niggardly and will drive them away by and by. It requires a good deal of practice to use a scale in such a way that, without your giving anything more than the strict weight, you create the impression of liberality. In measuring goods with a yard measure it is the same thing; it demands practice, and the first rule should be exactness and justice to both sides concerned—the seller and the buyer.

ODDS AND ENDS.

Economy can further be practiced by using your wrapping paper carefully and by never taking any more than necessary for immediate use, also by keeping it as much as possible in a cool place, out of draft, to prevent it from getting too brittle and thereby weak. Goods which you receive and unpack have in most cases their wrappings, boxes or twine well enough preserved that they can be made to do service once more, and there are always some spare moments in any salesman's business hours which he can utilize by making such odds and ends fit to be used over again.

ECONOMY IN GAS.

In many places of business it is necessary to have a light burning even during daytime, as without it desks or counters or storage rooms would be too dark to work in. Such lights should always be turned low if not really wanted for work. You will be astonished what a difference it makes after the end of a month in your gas bill if you mind your gas lights carefully.

In every packing room there might be a convenient hook fastened in the neighborhood of the packing counter or table, on which you should hang all the ends of twine which can be used over again, while a convenient space should be found for your odds and ends of wrapping paper and for your used boxes, none of which need go to waste.

GRATIFY YOUR CUSTOMER.

Empty pasteboard boxes will form very practical and welcome receptacles for nails and different Hardware. Mechanics who have to work outside prefer them greatly to paper wrappings. You will save by so doing the outlay for new wrapping paper and gratify your customer besides. Try to get rid of remnants of goods also, even if you have to sacrifice a cent or two. If, for instance, you can sell a remnant of picture wire, let us say one and three-quarter yards, it is more practical than if you would sell two yards which you would have to cut off from the piece.

It is also true economy to try and sell the last articles out of a lot rather cheaper than the regular price. This is wiser than to keep them and have them thrown into the background by the new stock, which always looks fresher and more inviting.

In leaving your place of business at night time you should turn off the gas at the meter and so prevent any possible leakage.

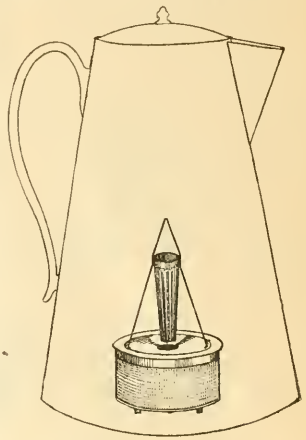
DON'T TRUST HIM.

It happens in every store once in a while that a customer is a few cents short, and even if you do only a cash trade with him you don't like to refuse him the goods on this ground. Be careful to charge such small items into his next purchase or to ask in a polite way for it directly. If the customer is honest he willingly pays it, and if not you have to make him pay it in some way or another and not trust him again.

Do not use any of your tools or belongings in a careless way and do not get into the habit of handling your merchandise as if it were imperishable. Many articles get shopworn in a short time on account of being carelessly handled. Consider all your goods as things which you hold, so to say, in trust for the purchaser and which you are bound to deliver in good order. This will save you many a loss and give your whole place the aspect of neatness and order, the precursors of well-doing and success.

Ideal Coffee Purifier.

Donathen Novelty Mfg. Company, 510 Broadway, Kansas City, Mo., are introducing the coffee purifier herewith shown. In operation the coffee is made in the usual way, by boiling, but one or two minutes before taking the coffee off the stove, while it is yet boiling, the purifier is dropped into the coffee pot. In a minute or two it is lifted out, when, it is stated, all the

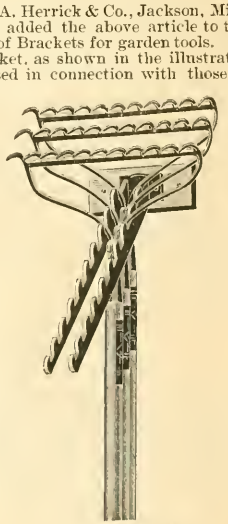


Ideal Coffee Purifier.

sediment will be found in the perforated tin box. The manufacturers claim that this device will enable any one with a common coffee pot or a tin pail to make as good coffee as could be made with the more complicated and expensive pouring coffee pots. The purifier is made in two sizes: No. 1 for 2 to 4 quart pots, and No. 2 for 4 to 6 quart pots.

New Rake Bracket.

F. A. Herrick & Co., Jackson, Mich., have added the above article to their line of Brackets for garden tools. The Bracket, as shown in the illustration, is used in connection with those for



New Rake Bracket.

Forks and Shovels, recently described. The Rake Bracket fits the same wall plate as the others, and is interchangeable with them, and projects the same distance from the wall as the former ones. The Bracket accommodates ten Rakes.

STOVE TRADE NOTES.

Stop the Leaks.

A well-informed correspondent in the stove trade, writing under the *nom de plume* "Economy," discusses features of business policy which at the moment are exceedingly appropriate. Among other things he says:

A good many business men in all lines are undoubtedly to-day speculating upon the possibilities of business during the latter half of the present year, and to what extent it will be affected or influenced by the recent and present financial disturbances in the country. I have met a good many in the stove business who look with more or less doubt upon the prospects for the fall trade, and are inclined to think that business will not be nearly as good as it was last year. It is a fact that this view obtains to a considerable extent, but not by any means in a panicky degree, and the convictions of those so minded are not so strong that poor business and disasters will come as to cause them to shut down their works, and quite generally foundries are being run as full as was anticipated and planned earlier in the year.

A monetary panic, such as the country has seen for the last six or seven weeks, does not necessarily create a panic among the industries, although it would be folly to urge that it does not have a disturbing effect upon business. There are few concerns but can point to incidents at such times that settle it beyond dispute that their business has been affected to a certain extent. I have in mind now a manufacturer who was called on by a builder and debtor a few weeks since, who had negotiated for a permanent loan on his new buildings, part of which he was to pay the range man, but the capitalist declined to perform his part of the contract and loan the money while the panicky condition of affairs in Wall street existed, and the range bill was unpaid.

It is useless to say that the stove man was not affected then and there by the Wall street disturbances—he was, to the extent of the delay of payment of $1000 due, and for every case of direct evidence there are always several not brought to direct notice, but the effect is felt. The havoc created by the flurry in the money market at the present time is largely confined to a certain class of brokers, whose wealth having been counted at inflated values, finds its true level, and they score an imaginary loss, and there is but little actual or material loss; although, of course, there are a good many men in the mercantile line who dabble more or less in stocks as a side issue, and suffer loss, when, either from timidity or compulsion, they sell their holdings. While there does not seem to be good reason to adopt radical measures of retrenchment in one's business affairs because of the stringency in the money market, or to go about with a pruning knife curtailing expenses, which itself has the effect of increasing or prolonging the conditions, the result of which it is sought to avoid, yet it is advisable for all good business men to exercise a little more circumspection over details, and guard against waste in their business. Retrenchment and cutting down expenses frighten the employees, who are apt to imitate and exercise extra economy on their part, with the result that money disappears from circulation very fast.

LOCATING THE LEAKS.

There is probably no stove house where the system of superintendence is so perfect that destruction, waste and loss do not take place more than they should, owing to the laxness of those in an overseeing capacity, and which cannot be stopped by increased vigilance.

In the selling department of the stove business alone there is always room for saving money without inflicting penalties or extra labor upon men or reducing their wages. Stoves while in transit from foundries to warehouse are bound to suffer more or less breakage, and, while it may be the duty of the boss carman or other person to look out for broken castings and duly file claims with the transportation company, he is quite apt to grow lax occasionally, especially when but one stove is found broken in a carload. Neglect in this instance to report the breakage or lay the claim seems of little account, and the smallness of the amount is sufficient to warrant him in letting it slide. It means a loss of $1 probably to the firm, however, and though small, 50 such cases a year make $50. The truckmen once in a while drift into carelessness, encouraged by the lack of proper inspection of goods when unloading at the store, and, as a consequence, two or more stoves in excess of the average are broken in hauling the contents of a car to the warehouse, and in a business of a carload a day it makes say 600 more broken stoves a year, or $600.

Now, if the same inattention exist on the part of the foreman having charge of porters, who pile up the stoves, $100 more may be safely added for extra breakage during the year in that department, and another $100 due to the carelessness in trucking out again for shipping.

THE SHIPPING DEPARTMENT.

The shipper may be a good servant, and, on the whole, make comparatively few mistakes, but he has become so familiar with his duties that he ticks off a delivery or shipping load with a dash inconsistent with absolute correctness, and has learned, too, to rely on certain of his draymen to detect at the shipping wharf an over or under shipment and bring back what was over, or alter the receipt if one or more are short, but he loses sight of the fact that extra trips to straighten out such innocent omissions increase the expense account. It may seldom or never happen that a stove is really lost in that way, but haste should never be held at a premium above correctness, and one should never excuse himself in making petty errors on the ground that they are not gross or vital.

Let us say that the shipper could save the house by simply curing these small omissions $150, and altogether we find that $1000 per year is being wasted—not wantonly or recklessly, but simply through a little relaxation of the ordinary watchfulness of employees. It does not appear prominently, nor would it be noticed against the profit and loss account in prosperous times, but would, if saved, be very acceptable in a bad year, and could be easily saved without subjecting anybody around to hardship. One thousand dollars saved by simply stopping a few small leaks! to say nothing about those in the repair department, credit and other departments of the house, which, in a business of the size indicated by the foregoing, would raise the amount to probably $5000, enough to turn loss to profit and save the business of a year, when others may be deploring the fact that they have worked a year for nothing and drawn on their surplus besides.

This may be such a year that a general survey of one's business now, and a few suggestions to clerks and employees in a pleasant way to give a little extra attention to the small things with a view to stopping the leaks, will prove to have been wise, and furnish those who adopt the plan reason to be very well satisfied with themselves, and inclined to remember your correspondent for his timely reminder.

Additions to the Fortune Line of Stoves.

We are indebted to the Thomas, Roberts, Stevenson Company, Philadelphia, Pa., for a number of handsome photographs of stoves which they have just placed upon the market. The patterns include heating stoves and ranges and are of a high order of merit. The first to which attention is invited is the Sterling Fortune, a first-class square base burner, made as a single and double heater. It is ornamented in a rather clever manner, nickel being used in such a way as to produce with the black iron very neat effects. A noticeable feature is the dome top, that portion directly over the fire being curved in such a way as to add to the brilliancy of its appearance when the stove is in operation. The Sterling Fortune is made with the nickel parts removable, so that they can be lifted off when it is desired to blacken the stove. The latter separates in the center, thus facilitating the setting up as well as repairing. It is made in three sizes and is fitted with Ransom's patent duplex and shaking grate. When made as a circulator the air is taken in at the bottom of the stove and passes up the flues, which are located in each corner and extend from the top to the bottom. Another novelty which the company have added to their assortment is the Ideal Fortune range, made in two sizes with right or left hand oven. In the decoration of this range a noticeable feature is the treatment of the oven door, which carries upon it a nickel-plated panel having the name "Ideal Fortune" in script letters. More or less cast ornamentation is em-

ployed, giving, in connection with the polished surfaces and nickel-plated portions, a rich and pleasing effect. The trimmings, such as handles, knobs, &c., are of the Alaska type. The oven, which is removable and made of wrought steel, measures 18 x 20 x 14 inches. There is a slide on the bottom of the oven by which its contents may be drawn out for the purpose of inspection or removal. There is also a cast-iron top oven plate to protect the steel oven. The stove has sheet flues and duplex or triplex grate, which can be removed without disturbing the fire brick or water back. The Ideal Fortune is made in the usual varieties, the photograph which we have before us showing five styles. Another range is the Colonial Fortune, made with right or left hand oven, and possessing the same general features as those enumerated in connection with the Ideal. This range, however, is intended especially for the building trades, and is made in portable form and well adapted for brick work. It has steel hot closets, plate racks, canopy, &c. The Active Fortune, known as No. 68, is another member of this general class, and is the same as the Colonial Fortune, except that it has horizontal boiler and upper hot closet. The boiler is concealed in its horizontal position by means of a cast-iron ornamental plate, which extends its entire length.

The Portsmouth Stove & Range Company.

We are indebted to the Portsmouth Stove & Range Company of Portsmouth, Ohio, for a copy of their second annual catalogue and price-list relating to the Model steel ranges. The volume in its general shape and size closely approximates the form of publication which has proved popular with the trade, the illustrations being numerous and the descriptive text ample for the purpose. In presenting this catalogue to the trade the company direct special attention to the steel range which they are offering under the name Model. It is made of extra heavy cold rolled steel, flanged and closely riveted, the oven being thoroughly braced throughout and the bottom plate of such a nature that it can be easily removed and replaced without dismounting any portion of the stove. The fire box employed in this range was patented April 21 of the present year. It is fitted with a heavy anti-clinker grate, and well ventilated linings, the method of ventilation being such that a current of cold air is supplied behind the linings as well as through small holes in the top of the fire back and ends. The front as well as the rear of the fire box is well lined, while an extra large hopper feed is provided, the door of which is also ventilated. Another feature of the Model range is the oven door, patented in September of last year, and so made that it is easily operated with the hand or foot, without the aid of weights, complex levers or other machinery liable to get out of order. The company provided a "simple, inexpensive and efficient device to prevent the startling and hideous noise that always follows when the door is thrown open and falls upon its supports." The arrangement of parts is such that the door is automatically retained in a closed position without the aid of latches, while an improved form of pedal or tumbler serves as a means for readily opening or closing the door. For this year the company have brought out a new style of the Model range provided with feet, and made in six sizes, adapted for burning hard or soft coal, coke or wood. This range has either solid or cut long centers, flat shaking and dumping grate, and can be had with either iron or tile linings. The company also make the range in cabinet style with nickel-plated back rail. The goods are illustrated in great variety and in connection with each style is given a description and price list. The Model steel range is shown with circulating boiler, also attached to charcoal broiler on brackets and the range provided with double ovens.

ODD PLATES.

The Leaf Stove Company is the name of the concern who succeed the Phillipsburg Stove Company of Phillipsburg, N. J. During the past year the company have had an efficient corps of pattern makers at work, and are now introducing to the trade a new and complete line of goods to be known as the Leaf stoves and ranges. For this reason the change in the name of the company has been made. Special attention is invited to the Maple Leaf, a large, well-finished six-hole high-oven range; also to the Holly Leaf, a five hole range, and to the Ivy Leaf, a neat and attractive parlor stove made as a double heater. The trade-mark consists of a leaf bearing in white letters the name and address of the company.

J. M. Davis, Great Falls, Mont., has recently brought to the attention of the trade a stove of novel construction, designed for the use of camping parties. The stove is made of sheet iron, and is so constructed that it can be folded up into very small space. It is said that a box 25 x 26 inches in size, and 2 inches deep, will carry the whole apparatus, including the stove pipe, which is telescopic in character. John Sinclair is associated with Mr. Davis in the patent, and we understand that this stove will shortly be put on the market. Orders from sheepmen and others have already been received for more than 30 of the stoves.

The Bennett & Peck Heating & Ventilating Company, Cincinnati, Ohio, were recently awarded the contracts for heating and ventilating the High School building at Centerville, Ohio, also a six-room school house, by the Board of Education, at Decatur, Ind., and an eight-room school house at South Bend, Ind.

The B. C. Bibb Stove Company, Baltimore, Md., have issued from the press an exceedingly attractive catalogue illustrating and describing the line of hot-air furnaces made by them. The publication is oblong in its general shape and bound in paper covers of a greenish tint, carrying a side title of neat design largely typographical in character. The early pages of the catalogue are devoted to remarks intended for would be purchasers of heating apparatus, following which are illustrations of the Sanitary hot-air furnaces made in portable form and also adapted for brick-setting. A table gives the dimensions of the Bibb Sanitary hot-air furnaces, together with the estimated heating capacity of the various sizes which are made. Another feature of the catalogue is found in a number of suggestions relating to the setting of furnaces, both portable form and those intended for brick work. A long list of testimonials are also given showing the popularity of the goods named.

The Michigan Stove Company have issued from their Chicago office a rather unique advertising novelty, consisting of a little pamphlet bearing the title "So Different." It is made up of 16 pages, measuring 4½ x 5¼ inches, and within its covers is a little story told in rhyme by Nixon Waterman, with sundry illustrations by Walter H Bradley. The story is of a young man who, thinking of marriage, is somewhat discouraged by the experience told by a friend of his, whose meals were always late, the cook mad, the house dreary and cold, and life anything but "a joy sublime." In fact, matters were so bad that a divorce case was in sight, when one day the married couple discovered that the trouble was due to the cooking and heating apparatus. They at once looked about for new stoves, and finally decided upon a Garland range and heater. The results of the change were so satisfactory that they invited their young friend to dine with them. He found things "so different" from what they were when he first considered the question of marriage that he changed his mind and decided to wed. The story is told in a pleasing style, and illustrated in a manner which emphasizes the fine points from beginning to end.

A. T. Nye & Sons, Marietta, Ohio, have added to their line of cook stoves for this year the Leader, which is said to embody the latest improvements. It is of attractive design and the workmanship is first class. The firm also have ready for the fall trade a new line of Round Oak Leaders, intended for burning wood, coal or gas. These goods are of neat and attractive design, have square bases, draw grates and air-tight joints. They are offered in five sizes, handsomely nickel plated. The makers have also brought out a dwarf stove, cheap in price, yet attractive in appearance, and is put upon the market under the name Opal. The goods above enumerated are now ready for the trade, and the makers are prepared to meet any reasonable demand for them on the part of consumers.

We are indebted to the Kelsey Furnace Company, 339 West Fayette street, Syracuse, N. Y., for an advance copy of an exceedingly neat catalogue which has just been issued from the press. It is a well arranged publication of 48 pages, bound in colored paper covers with side title of tasteful design, in which is wrought a representation of sections of a cold-air duct and hot-air pipe. The pages are devoted to an illustrated description of the Kelsey corrugated warm air furnace which, from the tone of the testimonial letters received by the company, is proving very popular with the trade. The heater has the base cast in one piece upon which rests the ash pit with a fitted joint to prevent all escape of dust into the hot-air chamber. The grate employed is of the Smythe patent, and the fire pot is of novel construction. The inside casing is of heavy steel, while the outside is of galvanized iron lined with asbestos sheeting and tin. A sectional view of the heater is given showing the passage of the air from the time it is taken in at the base of the heater until it escapes into the pipe at the top.

The Buckeye Stove Works of Canton, Ohio, send us photographs of two heating stoves which they are making in several styles and sizes. The first of these is the Oak Halcyon, of neat appearance and provided with nickel-plated foot rail. It is offered in four sizes, the diameter of the body of the stove at the

feed door being 11, 13, 15 and 17 inches respectively. The other photograph shows a neat cannon stove, made in three sizes and adapted for burning coal.

THE PENINSULAR STOVE COMPANY report a large number of visitors daily to their salesroom at 79-81 Wabash avenue, Chicago, as well as at their exhibit at the fair grounds. The company state that for the first five months this year their trade has shown a large increase over that for the corresponding period of 1892, and with the new stoves which they have recently introduced, together with the changes in their old lines, they expect business this year will show very gratifying results. One of the changes which they have made in their old lines is the open fret-work panels on their oven doors.

THE NORTH DIGHTON CO OPERATIVE STOVE COMPANY of North Dighton, Mass., favor us with a variety of advertising matter relative to the goods which they are offering to the trade. These include, among others, the Prize Oak, a neat six-hole construction made with draw center or plain grate and in a variety of styles and sizes. It has a large fire pot, three ring covers, sheet iron ash pan, patent oven-door opener and Alaska handles. Another leader of this company is the Live Oak, a range made with ventilated oven, triangular or duplex grate, direct damper and other features of utility. The White Oak is another member of this general class, made in four sizes and the usual modifications. The Oak Grand is still another novelty which is being brought out by the company and which is referred to as being first-class in every particular. A very neat heating stove is the Oak Leaf, made in three sizes.

GAS STOVES are beginning to be used in the southern portions of Europe. A private letter from the island of Malta, in the Mediterranean, mentions the adoption of such devices as a somewhat new feature there, and one which promises to become permanent. Their advantages for cooking in the hot weather, which prevails in Malta for the greater part of the year, have been found to be very material over the coal and coke ranges usually employed. A suggestion is made that good gas stoves of American patterns would find a profitable market there, where no duties on such goods exist.

UZAL CORY & Co., 210 Water street, New York, are offering an improved patented smoke pipe damper which they have just brought out. It is a combination of the Boston and common damper. It is entirely of cast iron, and so made that it can be readily attached to the pipe. The damper consists of a metal plate having four $\frac{7}{16}$-inch holes at the extreme back end. On the front is a solid apron of iron, the apron and damper being one casting, that deflects the gases around and through the damper, but away from the front opening when the damper is closed. From this point they pass up the chimney instead of into the room or cellar. The damper is riveted to a handle which automatically closes the damper and opens the check draft, or *vice versa*. It is now made in 6 and 7 inch sizes, but will be made larger and smaller if the trade warrants it.

ISAAC A. SHEPPARD & Co. of Philadelphia will soon bring out a new line of fire-place stoves bearing the name Fidelity. The stoves will be made in two sizes, 14-inch and 16-inch fire pots, and the fronts finished in Berlin black or full nickel. The makers state that they will be highly ornamental and that in design the requirements of Brooklyn, Philadelphia, Baltimore and Washington have been carefully studied.

THE WEBSTER OIL & GASOLINE COMPANY, 261 Federal street, Boston, Mass., are sending out their goods put up in a novel way. The oil is contained in cans holding $\frac{5}{6}$ gallon, six of which are packed in a case. A postal card, addressed to the firm, accompanies each, which the consumer is requested to mail when the case is empty and it will be removed and a full one substituted. The advantage claimed for this method is that the small cans are easily handled and are less likely to overflow the reservoir.

"THE METAL WORKER" has been favored with a handsome volume entitled "Illustrated Guide to Cincinnati," consisting of over 430 pages bound in cloth and gold, bearing an illuminated title-page, from the John Van Range Company, 169 Elm street and 4, 6, 8 and 10 Home street, Cincinnati, Ohio. The opening pages of the work are devoted to a description of the city, its resources, future possibilities, &c., followed by a history of the leading business houses and manufacturing establishments, among the latter being included that of the John Van Company, to which it refers as having established its now extensive business in 1854, nearly 40 years since, and, like the city, has grown to very large proportions from a very small beginning. The goods of the concern are distributed all over the country in the largest and most prominent hotels, restaurants and public institutions, withstanding the severest of tests. A number of minor details are also referred to, the article closing with the names of the officers of the company, who are as follows: L. E. Ziegle, president; C. H. Blanchard, vice-president; C. F. Koester, secretary and treasurer, and John Gibson, superintendent.

J. J. WILSON, the popular and well-known heating and ventilating expert, is making a visit to the principal cities of the West in the interest of the Fuller & Warren Company.

THE SCHUYLKILL VALLEY STOVE COMPANY of Spring City, Pa., will place on the market this season the Chief, a new six-hole, second-class range, designed to meet the demand for a range of medium price. Their Grand Chief range has been remodeled to some extent and now appears with a new ash pit. It has six holes, left-hand oven door, and is attractive in appearance. The Chief is made in two sizes and the Grand Chief in one size only. The company are also remodeling their Damascus square parlor stove and claim that they are considerably improving its adaptability to the heating of upper rooms.

THE GRANDER STOVE COMPANY of Royersford, Pa., are putting on the market the Volga square double heater. This is a handsome addition to their already large line. The distinctive features in the Volga are a revertible flue; the Ransom grate, which is a combination of the duplex grate with a surface grate on the outside; and a provision for the removal of the lower section of the front, a feature which it is claimed will be readily appreciated by dealers, as new cylinders can be fitted to the stove, when required, with little trouble. They are also introducing their new Torrid soft-coal stove, which is of square pattern having a center discharge grate. In design, it is handsome, and is gotten up to fill the demand for a low-priced soft-coal stove. The company are also preparing, and expect to have on the market in time for the fall trade, the Milton heater. It will be constructed on the double-heater principle, the base and fire chamber of cast iron and the upper chamber of sheet iron in a round form; the cylinder will be exposed except for the covering provided by an ornamental open screen surrounding it, thus permitting of air passing in and up between the casings to the heat pipe designed for transmitting heat to upper rooms. It will be provided with a register of such design as to allow of the stove being used as a single heater when desired, and the heat pipe will connect at the back of the crown top in such a manner as to allow of the use of a top ornament when used as a single heater, thus retaining its handsome appearance.

THE READING STOVE WORKS of Reading, Pa., have issued a catalogue of their Torrid and Torrid Sunshine steel plate warm-air furnaces. Pages 1 to 27 are devoted to descriptions of the furnaces, directions as to setting and piping, ventilation, and general information regarding heating by warm air. Additional pages A to L illustrate particularly the Torrid Sunshine furnaces and the Torrid Sunshine combination hot-water heater, by the use of which it is claimed from three to six rooms can be heated in addition to those heated by hot air, without appreciably diminishing the power of the furnace as a hot-air heater. The remainder of the book is devoted to price-lists and an abundant supply of testimoniala concerning the Torrid furnaces. The catalogue is well printed, and appears in handsome lithographed covers.

THE FAVORITE STOVE & RANGE COMPANY of Piqua, Ohio, have just issued from the press a supplement to their catalogue showing their new goods for the fall trade. The supplement is of the same size of page as the last catalogue and is intended to form a part of it. The new goods are handsomely illustrated and described in such a way that the dealer is informed concerning all the features of construction and operation. The Favorite base burner, "A series," is first given attention, following which is described the "B series," and then the Aileen, a very attractive direct draft cottage parlor stove for wood only. Two large corrugations in the bottom form a rest for the stove and increase, it is claimed, the radiating surface as well as the strength of the bottom. This stove is made in two sizes, taking, respectively, wood 20 and 22 inches in length. The company have also issued a pamphlet relating to the gas ranges, which are made in a variety of styles and sizes. The statement is made that the cast front doors and polished steel bodies will not tarnish or discolor, while they are easily blackened and kept in good condition. The ovens are 16 x 16 and 18 x 18 inches in size. The company also claim that the cast top and bottom oven plates will not rust, nor burn out. Under all top burners is a galvanized apron, while one hole on all the ranges is fitted with a double burner. The ovens and sections are so arranged as to be easily removed and replaced. The double oven burners are provided with two valves, all burners being operated with steel needle point valves,

with stop to prevent the thread entering the packing. The polished steel bodies of the ranges are lined with asbestos. The Favorite is made with and without the hot-water heater and step at the side. The fourth page of the pamphlet presents a bird's eye view of the company's works, the entire depth of the buildings being 1270 feet.

J. W. SHEELER, the energetic representative of The Reading Stove Works, is sending to his friends a long list of additions and improvements in the lines he represents, and states "the half has not been told." It is inferred that the remainder is reserved for personal visits.

THE READING STOVE WORKS, Orr, Painter & Co. of Reading, Pa., are this season adding to their line some new goods, and announce many improvements in their old styles. Among their additions are a new first-class circulating base burner and double heater under the name Golden Sunshine, a new six-hole range in five sizes, to be known as the Ideal Sunshine, a new cheap straight draft sheet-iron stove Gem Sunshine, in seven sizes, and the Laundry Sunshine, a new laundry stove in two sizes. Their improvements cover the rebuilding and reornamenting of their Royal Sunshine sheet-iron base burner and their Merry Sunshine and Parlor Sunshine stoves and double heaters. Improvements have also been made on their Othello and Home Sunshine ranges, which have been provided with a device to enable the duplex grates to be quickly and easily removed and replaced without disturbing any other part of the fire box. Their lines of Gay Sunshine and Hot Sunshine revertible flue sheet-iron stoves have been remodeled and two sizes have been added.

THE YEAGER-HUNTER SPRING CITY STOVE WORKS, Spring City, Pa., are putting on the market a square heater which they are calling the Bright New Era. It is offered as a cheap and effective heater, and is made single or double with straight draft and full revertible flue.

THE BUCKWALTER STOVE COMPANY of Royersford, Pa., have their new square heaters about ready for the market. They are pushing forward their new catalogue in the expectation of placing it in the hands of the trade by the middle of July.

A SPECIAL PAMPHLET on Acorn base burners has been issued by Rathbone, Sard & Co., Albany, and is decidedly attractive. The front is sky blue and is printed in two colors. It is profusely illustrated, printed in good, large type, and tells of the Royal Acorn, Princess Acorn, the Avenue Acorn Art parlor, Acorn square parlor, and the Art Westminster, with their special features.

MR. MACKNIGHT of the Mount Penn Stove Works, Reading, Pa., is managing to relinquish the cares of business sufficiently to allow of a visit to the Chicago Exposition. He will return about the end of the month.

THE HOT WAVE was so serious last week that a number of the stove foundries in Albany and Troy, N. Y., were obliged to shut down for a time.

J. G. YEAGER of the Yeager-Hunter Spring City Stove Works is making a lengthy visit to the World's Fair.

THE NEWLY ORGANIZED Columbia Furnace Company of Buffalo, N. Y., have elected Gustave F. Miller president, Horace K. Tallmadge vice-president, C. H. Bagley treasurer, Oliver W. Day secretary. All of the necessary arrangements have been made, and the concern will begin immediately to manufacture its new furnace.

MAJOR LITTLEFIELD, manager of the Littlefield Stove Company of Albany, N. Y., reports a fine outlook for the sale of West Shore ranges. The trade of the company exceeds that of last year, and another good season is expected. A number of new ranges in the West Shore line have been gotten out by the company.

THE MOLDERS' UNION of Albany, N. Y., has elected the following officers: President, James E. Roach; vice-president, William Burgess; recording secretary, John J. Sayres; financial secretary, Peter Donnelly; treasurer, Matthew Young; inductor, Conrad Weinline; doorkeeper, Charles Lavey; roll clerk, Henry Hoccur. Trustees: Joseph C. Pedlow, Michael Day, William Murdock, George Sharpe and Samuel Keith.

THE PERRY STOVE COMPANY, Albany, N. Y., are getting out many fine stoves for the season and expect large sales of the Argand lines of parlors and ranges. The Royal oil and gas stove lines are having almost unprecedented sales.

"PERFECT COOKING" is the title under which Isaac A. Sheppard & Co. of Philadelphia and Baltimore publish an interesting 24-page pamphlet descriptive of their Excelsior and Fidelity ranges. "Because a thing is to be used in a kitchen it does not necessarily follow that it must be ugly," says the writer of the pamphlet; and a glance at the fine illustrations in it would show that the firm have acted on the theory and have not spared any expense or labor to make their ranges handsome and artistic. The Excelsior and Fidelity range are well known to the trade. In describing the Fidelity ranges the firm announce that they now make their own range boilers for these ranges, and claim to be the only manufacturers in the stove trade doing so. Their boilers, they state, are made from extra heavy plate, either black or galvanized, in sizes varying from 34 x 10 inches to 39 x 14 inches, and are all tested to a pressure of 150 pounds to the square inch, and guaranteed against leakage. The pamphlet is well written and printed, and appears in a handsome cover, lithographed in colors, the front page depicting "ye olde way" of cooking by means of a pot suspended from a hook over a log fire, and the back page being ornamented with the medallion adopted as a trade symbol by the firm.

A. M. BLANCHARD, advertising manager of Rathbone, Sard & Co., Albany, N. Y., is spending two weeks in Chicago.

BUCK'S STOVE & RANGE COMPANY, St. Louis, Mo., are justly proud of their exhibit at the World's Columbian Exposition. This is the only stove concern represented from St. Louis, and, we believe, one of the few west of the Mississippi River. They have adopted a plan or method of illustrating the progress made in American manufacture, which is notable principally for its simplicity. It is strange that the same idea had not occured to manufacturers of other lines, but a search through the exposition fails to find one which can be called similar. The exhibit has already been referred to in these columns, and in brief is as follows: A chimney and fire place of the last century represents the early manufacture, while an old Clipper stove made by this house under date of 1846 represents the progress of a half century. As an exhibit of what they are at present making they show a finished stove of to-day's manufacture, which is in striking comparison with the Clipper of 50 years ago. Taking it altogether the exhibit is one which is attracting a great deal of attention from both the stove trade and others, as it follows more closely the primary object of the exposition—that is, showing the improvements made in art, science and manufacture. This company are now engaged on their 1893 catalogue, which will contain a number of new goods. Prominent among them are six family sizes and styles of Buck's steel ranges for all kinds of fuel, 16 sizes and styles of Buck's Fashion range for wood, in four and six holes, plain and high finish; 16 sizes and styles of Buck's Peerless range for coal and wood, in four and six holes, plain and high finish; four sizes of Buck's Flora, a low-priced cooking stove; three sizes of Buck's Brilliant hard coal base burner and ventilator; two styles Buck's Blazon hard coal base burner, a medium priced stove; two sizes of Franklin stove for hard or soft coal or coke, and four sizes and styles of Buck's Utopia wood heater, revertible flue base heater and direct draft.

EDWARD W. PECK, long known to the trade as the secretary and treasurer of the Rochester Co-operative Foundry Company, and recently first vice-president of the National Association of Stove Manufacturers, has assumed temporarily an additional duty. He has accepted the treasurership of one of the largest patent medicine houses in the country, that of the H. H. Warner Company of Rochester, whose financial matters recently became somewhat complicated, owing to the personal embarrassment of the president, Mr. Warner. Mr. Peck informs us that everything is looking favorable for the medicine company, whose financial matters are already shipshape and bound to come out all right. With characteristic modesty Mr. Peck disavows any personal responsibility for the improvement in the Warner Company's situation. His connection with the Co-operative continues, and is not affected in any way by the duties assumed in the side issue.

SHERMAN S. JEWETT & CO. of Buffalo, N. Y., favor us with photographs of two parlor stoves which they have added to their already varied and interesting assortment. Under the name of Jewett's Ext a they have brought out a fancy base burner, of graceful proportions and rich ornamentation. The entire design gives evidence of careful attention to details, while the treatment of the base, top and open-work section is exceedingly clever. Nickel is employed in a judicious manner in the embellishment of this parlor heater, and the urn which surmounts the top is of a high order of merit. The stove is first class in every particular and the constructive features of such a nature as to warrant the makers in expecting a large demand. The second photograph shows what is known as Jewett's Regent, a medium-priced base burner of tasteful ornamentation. It is embellished with nickel-plated base, name plate, foot rails, magazine panels, top rim, swing cover, ornaments, shaker, knobs and hinge pins, while it is surmounted by a handsome brass and nickel urn of somewhat conventional pattern. Constructively the stove is well made, and among other features has an automatic magazine cover.

TRADE REPORT.

The Iron Market.

Dullness approaching practical paralysis has character'zed the markets in Iron and Steel throughout the country. Nearly every merchant and manufacturer is more busily and anxiously engaged in putting his finances into unassailable shape than he is hunting for new business. In fact, sellers are closely scrutinizing the credit of customers, and reject any business which does not seem absolutely safe. There are sellers in plenty, providing they could get reasonably satisfactory prices, but as that cannot be done, except to a very limited extent, they simply wait until there is a demand. The recent failures that have occurred in Chicago and vicinity in the Iron trade have been precipitated solely by the scarcity of money and the difficulty in securing banking accommodations.

Pig Iron.—Complaints of very dull trade are quite general in the New York market, and special transactions are becoming relatively numerous. We quote Northern brands at $14.50 @ $15 for No. 1; $13.75 @ $14.50 for No. 2, at tidewater. Southern Iron, same delivery, $13.75 @ $14.50 for No. 1; $12.50 @ $13.50 for No. 2; $12 @ $12.25 for No. 3; $12.25 @ $12.50 for No. 2 Soft, and $12.75 @ $13.25 for No. 1 Soft.

Good brands are scarce in and about Philadelphia, and command pretty full prices for such small lots as are called for, but the bulk of the deliveries are on old contracts, with no great disposition to enter into new engagements for large lots. The decrease in stocks combined with a decreased production are points in sellers' favor, which may assume great importance later on, and while, as yet, they only attract passing attention and have not stimulated buying, they have stiffened holders considerably. Sales have been at about the following quotations for Philadelphia deliveries, and at nearby points accessible by water from the South 20¢ @ 30¢ less, but a good deal depends on quantity, delivery &c.:

American Scotch, No. 1X...	$16.00	@ $16.50
American Scotch, No. 2X...	15.00	@ 15.50
Lake Superior Charcoal.....	$16.25	@ $16.50
Local Coke Foundry, No. 1...	13.75	@ 14.25
Local Coke Foundry, No. 2...	13.00	@ 13.25
Local Coke Foundry, No. 3...	12.75	@ 13.00

In the Chicago market local Coke Irons have been in reasonably fair demand. Notwithstanding the generally poor condition of business there seems to be a class of consumers who are in need of Iron of this quality, but they are, of course, taking it only in small quantities. On this kind of business our quotations fairly represent the market. Quotations are as follows, cash, f.o.b. Chicago:

Foundry.

Southern Coke, No. 1.	$13.00 @ $13.25
Southern Coke, No. 2.....	11.50 @ 11.75
Southern Coke, No. 3.....	11.00 @ 11.25
Ohio Soft Stone Coal, No. 1....	16.00 @ 16.25
Ohio Soft Stone Coal, No. 2....	15.00 @ 15.25
Lake Superior Coke No. 1.....	15.00 @ 15.25
Lake Superior Coke No. 2.....	14.00 @ 14.25
Hanging Rock Charcoal, No. 1..	18.50 @ 19.00
Hanging Rock Charcoal, No. 2..	17.50 @ 18.00
Tennessee and Alabama Charcoal, No. 1.....	15.00 @ 15.50
Tennessee and Alabama Charcoal, No. 2.....	14.00 @ 14.50

The volume of business in Pig Iron seems to be reduced to its lowest terms in Southern markets. There is absolutely no buying for forward delivery, and only the current necessities of consumers are purchased in small quantities, mainly in single car lots, and they rarely reach as much as 500 tons. There is no urgency to sell Pig Iron for forward delivery, the main endeavor being to find cash buyers, and if there were any of these there is no doubt that they could secure much stock at lower prices, but no transactions have become public that would justify reduced quotations, although the whole market seems to be so far demoralized that quotations are little better than nominal. Quotations are as follows:

Metal Market.

Pig Tin.—Since the date of last week's review the price of Straits Tin for prompt and current month delivery has been carried from 19.90¢ up to 20.25¢; July delivery was raised to 20.42½¢ and remote deliveries relatively as high on paper. More recently prices have reacted to 20.12½¢ for prompt delivery and quite as much on futures. There was some sign of softness at the close, spot stock having been sold on Wednesday at 20.10¢ @ 20½¢, and June delivery at 20⅜¢, one day's notice.

Copper.—Regarding the rumored sales of Lake Superior Ingot at 10½¢, nothing has transpired except that persons supposed to be well informed deny knowledge of any contracts having been made at that price.

Pig Lead.—Fully 1500 tons of Common Domestic have been sold at from 3.75¢ down to 3.60¢, and the official bullion price has dropped to 3.55¢. The purchases were chiefly of Lead for late June and July shipment from the West. At the close, 3.55¢ bid, 3.60¢ asked, was quoted.

Spelter.—Dealings here have been on a very moderate scale, and the demand at present is extremely tame. Prices are difficult to gauge in the absence of business, but 4.20¢ @ 4.30¢, delivered, would seem to be a fair range of quotations on Western brands.

Antimony.—Business has been moderate and prices are somewhat irregular, with 9¾¢ @ 10¢ quoted for Hallett's, 10½¢ @ 10¾¢ for L.X. and 10½¢ for Cookson's.

Tin Plate.—The market is dull and weak. Canners and canmakers are not only very indifferent buyers, but it would appear, have, in some instances, sought to have deliveries deferred. From other sources the demand is strictly perfunctory. Late arrivals add considerably to the stock on spot and the assortment is fuller than it has been for some time past. The demand from retailers is small, while the financial standing of all customers is closely scrutinized.

Chicago Report.

Scrap.—The market is very dull. Dealers quote buying prices as follows:

	Per net ton.	Per lb
No. 1 Wrought Scrap.....	$12.00	....
Machinery Cast.....	9.00	....
Malleable Cast.....	7.00	....
Stove Plate (free of burnt)..	6.50	....
Burnt Iron and Grate Bars..	4.00	....
Sheet Iron and Hoops.. .	3.00	....
Plow Steel and Breaking Stock.....	8.00	....
No. 2, such as Shovels, Hoes, &c.....	4.50	....
Old Boilers—whole (Iron)....	7.00	....
" (Iron)—cut in single Sheets and Rings..	10.00	....
Old Gas-Pipe and Boiler Tubes.....	7.50	....
Cast Borings.....	4.00	....
Turnings.....	5.50	....
Horseshoes.....	12.00	....
Copper Bottoms.....	....	8 ¢

CONDITION OF THE

Hardware Trade.

WITH THE ADVANCE of the season it is natural to expect a falling off in the volume of general business, but a fair trade is reported, principally from retail merchants whose business in many sections of the country is in excellent condition, they being apparently unaffected by the financial conditions which are influencing the large trade. A considerable volume of business is thus being done, and in all parts of the country large quantities of goods are entering into consumption. A good many manufacturers are still well occupied on orders, but the majority are preparing for the summer dullness. While there is a good deal of complaint in regard to collections there is a commendable disposition on the part of many merchants to make exceptional efforts to settle their accounts promptly, knowing that this will be appreciated by those from whom they purchase in view of the existing stringency of the money market. Prices on the whole are without important change, but in several staple lines the tone of the market is weak and irregular. Manufacturers are, however, prudently refraining from endeavoring to force goods on the trade by means of concessions in price, and, as a rule, in Shelf Hardware former quotations are quite generally maintained.

Advices from Chicago.—The Shelf Hardware trade has been very good for some time, and the first mails this week indicated further improvement. Country merchants are now coming in to see the fair. A very considerable number made their appearance last week, probably as many as in all previous weeks combined. Jobbers say that they do not find them coming in to buy any considerable quantity of goods, yet nearly every one makes out a bill for some little stock. The demand now is of a general character including the whole line of Hardware. Staple goods are also doing better. Builders' Hardware, however, is considerably behind past seasons, showing that building improvements are not being pushed with much vigor. Prices show no special change, except that Wire Cloth is growing still scarcer and those who have stock now ask $2.25. Poultry Netting is also very firm and in comparatively light supply. Collections have improved in Shelf Hardware, but are not yet what they should be and what jobbers would like to see. The volume of business in Heavy Hardware is less than last month, but in some directions trade is a little better. The pleasant weather continues, and while the trade in heavy wagon material is fully as large as in past seasons, quite a number of manufacturing consumers report their business quiet and are consequently purchasing very much less stock than usual.

Notes on Prices.

Cut Nails.—The demand for Cut Nails is light and diminishing and prices also show evidence of further receding. The market in the East is represented in a general way by the quotation of $1.05 on carload lots at mill, but offers have been made and some sales effected at a somewhat lower figure. Small lots from store in New York are held at about $1 35. Many of the mills are preparing for the usual shut down in July for inventory, repairs and general overhauling. The condition of the market will not unlikely in many cases induce a longer stoppage than usual.

Advices from Chicago.— Manufacturers of Cut Steel Nails are in receipt of a fair amount of business, but trade is by no means large. Specifications are being held back to some extent on old contracts, which also makes business rather quiet and causes some anxiety for the receipt of fresh orders. The retail trade in the extreme Northwest has been cut off by the very low freight rates now ruling from Wheeling to Duluth by rail and lake. The Wheeling manufacturers are reported to be quoting very low prices in this vicinity also, but it is stated that such prices are only made on an average above base, which will give the manufacturers some little advantage. Prices on factory lots here are now about $1.20 to $1.25. Jobbers quote small lots from stock $1.30.

Wire Nails —There has been little change in the general situation during the past week or two, but the market is, perhaps, on the whole, in a somewhat better condition. It has not, apparently, been affected by the embarrassment of the Baackes Wire Nail Company, and it is understood that the company's stock of Nails are being held at good prices, which are somewhat in advance of the lowest prices recently prevailing. Some of the mills also are withdrawing their extreme quotations and refusing to meet the lowest prices of some of their competitors, their impression being that with the stoppage of the mills during July the market will be relatively clear of Nails, which should have a strengthening influence on prices. In anticipation of this shut down a number of orders are also being received from the trade. At the present time our former quotation of $1.35 for carload lots at mill still fairly represents the market, notwithstanding the fact that during the past week it has been slightly shaded.

Advices from Chicago.— Wire Nail manufacturers state orders are coming in more freely from outside points. The smaller jobbers throughout the Northwest are sending in orders without solicitation; large buyers here, however, are reported to be well stocked, having taken in considerable quantities when the break in prices occurred some two or three weeks back. The indications now seem to point to stiffer prices. Agents have been advised within the past few days that there will be a pretty general shut down of the factories on July 1, which will so heavily curtail production that they think a slightly better price should be asked for delivery after that time. The general quotation on factory lots is still $1.50, Chicago, but some of the mills referred to are naming $1.52½. They expect that this will stiffen the market, but it remains to be seen whether the trade is not so well stocked up that the restriction of production contemplated will be easily endured. Jobbers report a better inquiry from their trade now that prices have receded. They quote $1.60 in a regular way and $1.55 in mixed carloads.

Barb Wire.—The Barb-Wire market is sluggish, the volume of business being only fair and prices giving some indications of weakness. We still quote $2.45 to $2.50 for carload lots at mill, with concessions in special cases.

Advices from Chicago.—The factories are now catching some of the business which they lost early in the year. Manufacturers report the demand remarkably good for this season, keeping up at a time of the year when it usually falls off. Prices are unchanged at $2.15 for Painted and $2.55 for Galvanized from factory, and $2.30 to $2.70 for small lots from stock.

Glass.—The market is without interest, dull and featureless, with but a small amount of Glass changing hands. A conservative policy is being pursued by dealers in the matter of extending credits, satisfied to do less business until the financial horizon brightens. At the regular meeting of the National Window Glass Company, held at Chicago last week, the general situation was discussed, but no change in list or prices was made. Under the present condition of affairs it is not at all improbable that all the factories will be closed down before July 1. A large number of contracts with importers of foreign Glass expire July 1, and until then there is little likelihood of any advance in prices. Trade in all kinds of Window Glass is very quiet, with no change in prices. We understand that every Plate Glass factory in the country is closed, an arrangement agreed to by all the companies with a view to stop production and reduce the present accumulated stocks. Demand has improved a little with favorable weather, but did not keep up with the weekly production of about 182,300 feet. Quoted prices remain unchanged, as follows: American Window Glass, 2000 boxes at one time, 80 and 10 and 10 per cent. discount; carloads, 400 boxes, 80 and 15 per cent. discount; less quantities than carloads, 80 and 10 per cent. discount. Freight allowed on car lots and over, not to

exceed 17½ cents per 100 pounds ; less than car lots, f.o.b. at shipping point. French Window Glass, 75 and 10 and 5 per cent. discount. American Plate ranges in price from 50 and 10 and 7½ per cent. discount to 60 and 5 per cent. discount. Imported Plate Glass, 60 per cent. discount to 60 and 10 and 5 per cent. discount.

Old Rubber.—The following are the current prices paid for Old Rubber delivered in New York:

Car Springs, ton lots, ₽ lb.	....	@	$0.03½
Rubber Shoes, ton lots ₽ lb.	....	@	.04

Manila Rope	₽ lb	2½¢
Jute Rope	₽ lb	1½ @ 2 ¢
Mixed Rope	₽ lb	¾ @ ⅞¢

Trade Notes.

H. A. Tweed, for many years connected with the United Nickel Company and the N. Y. Nickel Plating Company, is in New York. During the past ten years he has resided in Phœnix, Arizona, where he is extensively engaged in the mining business, and where he has met with unusual success in all his business ventures. During his sojourn here he will be the guest of George F. Dodge, president of the N. Y. Nickel Plating Company.

The Buhl Stamping Company, Detroit, Mich., issue a seasonable circular directing attention to some of the specialties of their manufacture. The double page price-list relates principally to Milk Cans, including a variety of patterns of Railroad Cans. Cheese Factery Milk Cans are also noted, as well as Gauges, Covers and other supplies. The back of the circular is devoted to Buhl Tubular Lanterns and Headlights. Brief descriptive particulars and tables of sizes and prices accompany the illustrations of goods.

Among recent contracts secured by E. T. Barnum, Detroit, Mich., is one for the ornamental Wrought Iron Fence, 395 feet in length, to inclose the Rural Cemetery, Waldoboro, Maine. The fence is to have six large double gates at the driveways and three smaller ones for the footpaths.

The Niagara Stamping & Tool Company, Buffalo, N.Y., issue a postal circular calling attention to the increased competition and to the fact that they are abreast of the times with their improved Tools, Machinery and Dies for working sheet metal. They also note their exhibit at Chicago, which is at Machinery Hall Annex, Section 28, Column L-46.

The New Kensington Mfg. Company, New Kensington, Pa., have been granted a charter of incorporation, with a capital of $8000, for the manufacture and sale of Enameled Iron and Steel, Brass and Tin goods.

The Detroit Dynamo Company, Detroit, Mich., issue a circular devoted to "Nineteenth Century Figures," designed for house numbers, which are supplied in various finishes, as follows: Plain bronze, plain brass, antique copper and brass, old copper, old brass, Bower-Barffed and nickel plated. Roman Metal Figures for the same purpose are furnished in nickel plate 2, 2½ and 3 inches in size.

A mistake in the firm's address was made in a note in last week's *Metal Worker* respecting the contract of E. T. Barnum for fittings for the cavalry stables at Fort Leavenworth, Kansas. The address, it is hardly necessary to state, should have been Detroit, Mich.

The New Kensington Mfg. Company of New Kensington, Pa., have been incorporated for the manufacture and sale of Japanned and Enameled Iron, Steel, Brass and Tin Goods, and Japans, Varnishes and Enamels. The directors are Hugh A. Gallagher, Robert H. Bellman and Frederick Dindlen of New Kensington.

John Sweeney & Co., New York and Chicago, issue a very handsome poster calling attention to the Columbian Souvenir Stove Board of their manufacture. The poster, which measures 20 x 14 inches, is decorated with a reproduction in gilt and black ink of the Columbian Souvenir Stove Board. The design is handsome and particularly appropriate for the present season. The center shows four eagles, while in the middle are horns of plenty. A lot of little gilt cupids, riding bicycles, frame this central panel, while on the outer line are portraits of Columbus and pictures of the strange crafts in which he ventured over the Atlantic.

Oscar Roessler, proprietor of the Roessler Stove Polish Works, at Warsaw, Ills., is sending to the trade a series of circulars calling attention to his line of Stove Polish. The Black Luster Paste Stove Polish, which has been on the market a number of years, is referred to as being more popular than ever, and is put up in 5 and 10 pound cans. Attention is also called to the Black Luster Liquid Stove Polish, which is put up in convenient shape for family use. In the line of benzine polishes Mr. Roessler has his Black King, which he claims is the quickest, blackest and best. Mr. Roessler has also introduced what is known as Lusterine, which is intended for use in keeping metal bright, and is particularly adapted for use in hardware and stove stores for articles that need occasional polishing. It is also adapted for polishing gold and silver ware, brass railings, brass or zinc signs, showcases, harness trimmings, &c. It is put up in 4-ounce bottles for domestic use, and ½-gallon cans for stove dealers, engineers, mechanics and general factory use.

James Donaldson & Co. have recently opened a kitchen and stove furnishing store at 1036 Boylston street, Boston, Mass., where they will carry a complete line of Tinware and Oil stoves.

J. E. Titzell, who for two years past has been traveling on the road in the interests of B. M. Savery of Cliff street, New York, has returned to take charge of his stove and tin store at Millerstown, Pa.
